Abstract

This is a description and documentation of the installation of the current NLP modules on Lisa, so that they can be used in pipelines.

Contents

1 Introduction

This document describes the current set-up of pipeline that annotates dutch texts in order to extract knowledge. The pipeline has been set up by the Computational Lexicology an Terminology Lab (CLTL [1]) as part of the newsreader [2].

Apart from describing the pipeline set-up, the document actually constructs the pipeline. The described version has been made with an aim to run it on a specific supercomputer (Lisa, Surfsara, Amsterdam [3]), but it can probably be implemented on other unix-like systems without problems.

The installation has been parameterized. The locations and names that you read (and that will be used to build the pipeline) have been read from variables in file `inst.m4` in the nuweb directory.

1.1 List of the modules to be installed

Table 1 lists the modules in the pipeline. The column *source* indicates the origin of the module. Ideally, modules are directly obtained from a public repository, e.g. Github, or from a website of the organisation where the module has been built. However, some of the modules are not yet available in this way and only a snapshot has been installed by hand in Lisa. Table /reftab:modulesources provides the URL's of the sources that have been obtained from a public repository.

The modules themselves use other utilities like dependency-taggers and POS taggers. These utilities are listed in table 2.

Table 3 lists the source of the modules and utilities that can be installed from an open source.

Table 3: Sources of the modules

1.2 File-structure of the pipeline

The files that make up the pipeline are organised in set of directories:

nuweb: This directory comntains this document and everything to create the pipeline from the open sources of the modules.

modules: Contains the program code of each module in a subdirectory. Fuurthermore, it contains a subdirectory `python` for python software-modules, subdirectory `jars` for jar files and subdirectory /usrlocal/ for binaries and libs that are used by modules.

bin: Contains for each of the modules a script that reads NAF input, passes it to the module in the `modules` directory and produces the output on standard out. Furthermore, the subdirectory contains the script `install-modules` that performs the installation, and a script `test` that shows that the pipeline works in a trivial case.

nuweb: Contains this document, the nuweb source that creates the documents and the sources and a Makefile to perform the actions.

2 Installation

This section describes how the modules are obtained from their open-source and installed. This is performed by script `install-modules`

"../bin/install-modules" 5c≡

```
#!/bin/bash
⟨ variables of install-modules 17e ⟩
⟨ install the tokenizer 7b ⟩
⟨ install kafnafparserpy 14c ⟩
⟨ install Alpino 8a ⟩
⟨ install the morphosyntactic parser 8g ⟩
⟨ install the NER module 10a ⟩
⟨ install the WSD module 10d ⟩
⟨ install the onto module 11c ⟩
⟨ install the heideltime module 12c ⟩
⟨ install the srl module 13d ⟩
⟨ install the treetagger utility 15b, ... ⟩
⟨ install the ticcutils utility 16d ⟩
⟨ install the timbl utility 17a ⟩

◇
```

⟨ *make scripts executable* 5d ⟩ ≡

```
chmod 775  /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/bin/install-modules
```

◇

Fragment defined by 5d, 7g, 9ae, 10c, 11b, 12b, 13c, 14b, 15a.
Fragment referenced in 30b.

Installation goes as follows:

1. If the module exists already, move it to a temporary place.
2. Try to install the module from the source.
3. If that is successful, remove the old version. Otherwise, move the old version back to its original place.

The following macro's move or remove modules.

⟨ *move module* 6a ⟩ ≡

```
if
 [ -e @1 ]
then
   mv @1 old.@1
fi
◇
```

Fragment referenced in 6e, 8a, 18b.

⟨ *remove old module* 6b ⟩ ≡

```
rm -rf old.@1
◇
```

Fragment referenced in 6e, 8a, 18b.

⟨ *re-instate old module* 6c ⟩ ≡

```
mv old.@1 @1
MESS="Replaced previous version of @1"
⟨ logmess (6d $MESS ) 18a ⟩

◇
```

Fragment referenced in 6e, 8a, 18b.

The following macro can be used to install a module from github. It needs as parameters:

1. Name of the module.
2. Name of the root directory.
3. URL to clone from.

⟨ *install from github* 6e ⟩ ≡

```
MODNAM=@1
DIRN=@2
GITU=@3
⟨ find leave and tree 7a ⟩
⟨ logmess (6f "TREE: $TREE; LEAVE: $LEAVE" ) 18a ⟩
cd $TREE
⟨ move module (6g $LEAVE ) 6a ⟩
git clone $GITU
if
  [ $? -gt 0 ]
then
  ⟨ logmess (6h Cannot install current $MODNAM version ) 18a ⟩
  ⟨ re-instate old module (6i $LEAVE ) 6c ⟩
else
  ⟨ remove old module (6j $LEAVE ) 6b ⟩
fi

◇
```

Fragment referenced in 7b, 8g, 12c, 14c.

Note: Par. 1: Directory; par 2: path to directory; par 3: directory name.

⟨ *find leave and tree* 7a ⟩ ≡
```
FULLDIR=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/$DIRN
LEAVE=${FULLDIR##*/}
TREE=${FULLDIR%%$LEAVE}
```
◇
Fragment referenced in 6e.

2.1 Install tokenizer

2.1.1 Module

⟨ *install the tokenizer* 7b ⟩ ≡

⟨ *install from github* (7c `tokenizer`,7d `tokenizer-base`,7e `https://github.com/opener-project/tokenizer-base.git`
◇
Fragment referenced in 5c.

2.1.2 Script

The script just runs the tokenizerscript in Perl.

`"../bin/tok"` 7f≡
```
#!/bin/bash
ROOT=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa
TOKBINDIR=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/tokenizer-base/core
cat | perl $TOKBINDIR/tokenizer-cli.pl -l nl t
```
◇

⟨ *make scripts executable* 7g ⟩ ≡
```
chmod 775  /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/bin/tok
```
◇
Fragment defined by 5d, 7g, 9ae, 10c, 11b, 12b, 13c, 14b, 15a.
Fragment referenced in 30b.

2.2 Install Alpino

Install Alpino from the website of Gertjan van Noort.

2.2.1 Module

⟨ *install Alpino* 8a ⟩ ≡

```
SUCCES=0
cd /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules
⟨ move module (8b Alpino ) 6a ⟩
wget http://www.let.rug.nl/vannoord/alp/Alpino/binary/versions/Alpino-x86_64-linux-glibc2.5-20548-sic
SUCCES=$?
if
  [ $SUCCES -eq 0 ]
then
  tar -xzf Alpino-x86_64-linux-glibc2.5-20548-sicstus.tar.gz
  SUCCES=$?
  rm -rf Alpino-x86_64-linux-glibc2.5-20548-sicstus.tar.gz
fi
if
  [ $SUCCES -eq 0 ]
then
  ⟨ logmess (8c Installed Alpino ) 18a ⟩
  ⟨ remove old module (8d Alpino ) 6b ⟩
else
  ⟨ re-instate old module (8e Alpino ) 6c ⟩
fi
◇
```

Fragment referenced in 5c.

Currently, alpino is not used as a pipeline-module on its own, but it is included in other pipeline-modules. Modules that use Alpino should set the following variables:

⟨ *set alpinohome* 8f ⟩ ≡

```
export ALPINO_HOME=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/Alpino
◇
```

Fragment referenced in 8k.
Defines: `ALPINO_HOME` Never used.

2.3 Morphosyntactic parser

2.3.1 Module

⟨ *install the morphosyntactic parser* 8g ⟩ ≡

```
⟨ install from github (8h morphsynparser,8i morphosyntactic_parser_nl,8j https://github.com/cltl/morphosyntac
◇
```

Fragment referenced in 5c.

2.3.2 Script

"../bin/mor" 8k≡

```
#!/bin/bash
ROOT=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa
MODDIR=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/morphosyntactic_parser_nl
⟨ set alpinohome 8f ⟩
⟨ set pythonpath 5a ⟩
cat | python $MODDIR/core/morph_syn_parser.py
◇
```

⟨ *make scripts executable* 9a ⟩ ≡
```
chmod 775  /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/bin/mor
◇
```

Fragment referenced in 30b.

2.4 Alpino hack

Install a hack that removes output from Alpino that cannot be interpreted by following modules. It is just a small python script.

2.4.1 Module

⟨ *directories to create* 9b ⟩ ≡
```
/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/alpinohack ◇
```
Fragment defined by 4abcdef, 9b, 24b.
Fragment referenced in 30a.

"../modules/alpinohack/clean_hack.py" 9c≡
```
#!/usr/bin/python
import sys

input = sys.stdin

output = ''

for line in input:
    line = line.replace('"--','"#')
    line = line.replace('--"','#"')
    output += line

print output

◇
```
Uses: print 23b.

2.4.2 Script

"../bin/alpinohack" 9d≡
```
#!/bin/bash
ROOT=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa
HACKDIR=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/alpinohack
cat | python  $HACKDIR/clean_hack.py

◇
```

⟨ *make scripts executable* 9e ⟩ ≡
```
chmod 775  /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/bin/alpinohack
◇
```

Fragment referenced in 30b.

2.5 Named entity recognition

2.5.1 Module

We do not (yet have the source code of the NER module. A snapshot is comprised in a jar library.

⟨ *install the NER module* 10a ⟩ ≡
```
cp /home/phuijgen/nlp/snapshots/jars/ixa-pipe-nerc-1.1.0.jar ../modules/jars/
```
◇

Fragment referenced in 5c.

2.5.2 Script

"../bin/ner" 10b≡
```
#!/bin/bash
ROOT=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa
JARDIR=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/jars
cat | java -jar $JARDIR/ixa-pipe-nerc-1.1.0.jar tag
```
◇

2.6 Wordsense-disambiguation

We do not yet have a source-repository of the wsd module. Therefore, install from a snapshot on Lisa.

2.6.1 Module

⟨ *install the WSD module* 10d ⟩ ≡
```
cp -r /home/phuijgen/nlp/snapshots/wsd /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/
```
◇

Fragment referenced in 5c.

2.6.2 Script

"../bin/wsd" 11a≡

2.7 Ontotagger

We do not yet have a source-repository of the Ontotagger module. Therefore, install from a snapshot on Lisa.

2.7.1 Module

⟨ *install the onto module* 11c ⟩ ≡

```
cp -r /home/phuijgen/nlp/snapshots/ontotagger /home/phuijgen/nlp/dutch-nlp-modules-on-Lisa/modules/
◇

2.10 KafNafParserPy

Several modules use KafNafParserpy to read and write NAF files.

2.10.1 Module

⟨ install kafnafparserpy 14c ⟩ ≡

```
⟨ install from github (14d kafnafparserpy,14e python/KafNafParserPy,14f https://github.com/cltl/KafNafParserP

3 Utilities

3.1 Test script

The following script pushes a single sentence through the modules of the pipeline.

"../bin/test" 14g≡
```
#!/bin/bash
ROOT=/home/phuijgen/nlp/dutch-nlp-modules-on-Lisa
BIND=$ROOT/bin
echo "De hond eet jus." | $BIND/tok | $BIND/mor | \

3.2 Treetagger

3.2.1 Module

Installation goes as follows (See Treetagger's homepage:

1. Download and unpack the treetagger tarball. This generates the subdirectories `bin`, `cmd` and `doc`
2. Download and unpack the tagger-scripts tarball

The locatioan where treetager comes from and the location where it is going to reside:

⟨ *install the treetagger utility* 15b ⟩ ≡
```
TREETAGDIR=treetagger

Parametersets:

⟨ *install the treetagger utility* 15d ⟩ ≡
```
DUTCHPARS_UTF_GZ=dutch-par-linux-3.2-utf8.bin.gz
DUTCH_TAGSET=dutch-tagset.txt
DUTCHPARS_2_GZ=dutch2-par-linux-3.2-utf8.bin.gz
```
◇

3.3 Timbl and ticcutils

3.3.1 Module

Timbl and ticcutils are installed from their source-tarballs. The installation is not (yet?) completely reproducibe because it uses the currently available c-compiler. Installation involves:

1. Download the tarball in a temporary directory.
2. Unpack the tarball.
3. cd to the unpacked directory and perform `./configure`, `make` and `make install`. Note the argument that causes the files to be installed in the `usrlocal` subdirectory of the modules directory.

A How to read and translate this document

This document is an example of *literate programming* [1]. It contains the code of all sorts of scripts and programs, combined with explaining texts. In this document the literate programming tool `nuweb` is used, that is currently available from Sourceforge (URL:`nuweb.sourceforge.net`). The advantages of Nuweb are, that it can be used for every programming language and scripting language, that it can contain multiple program sources and that it is very simple.

A.1 Read this document

The document contains *code scraps* that are collected into output files. An output file (e.g. `output.fil`) shows up in the text as follows:

"output.fil" 4a ≡
```
# output.fil
< a macro 4b >
< another macro 4c >
◇
```

The above construction contains text for the file. It is labelled with a code (in this case 4a) The constructions between the < and > brackets are macro's, placeholders for texts that can be found in other places of the document. The test for a macro is found in constructions that look like:

< a macro 4b > ≡
```
This is a scrap of code inside the macro.
It is concatenated with other scraps inside the
macro. The concatenated scraps replace
the invocation of the macro.
```

```
Macro defined by 4b, 87e
Macro referenced in 4a
```

Macro's can be defined on different places. They can contain other macroÂ´s.

< a scrap 87e > ≡
```
This is another scrap in the macro. It is
concatenated to the text of scrap 4b.
This scrap contains another macro:
< another macro 45b >

A.4 Pre-processing

To make usable things from the raw input `a_dutch-nlp-modules-on-Lisa.w`, do the following:

1. Process `$` characters.
2. Run the m4 pre-processor.
3. Run nuweb.

This results in a LaTeX file, that can be converted into a PDF or a HTML document, and in the program sources and scripts.

A.4.1 Process 'dollar' characters

Many "intelligent" TeX editors (e.g. the auctex utility of Emacs) handle `$` characters as special, to switch into mathematics mode. This is irritating in program texts, that often contain `$` characters as well. Therefore, we make a stub, that translates the two-character sequence `\$` into the single `$` character.

⟨ *expliciete make regels* 21a ⟩ ≡

```
m4_dutch-nlp-modules-on-Lisa.w : a_dutch-nlp-modules-on-Lisa.w
        gawk '{if(match($$0, "@%")) {printf("%s", substr($$0,1,RSTART-1))} else print}' a_dutch-nlp-m

A.5 Typeset this document

Enable the following:

1. Create a PDF document.
2. Print the typeset document.
3. View the typeset document with a viewer.
4. Create a HTMLdocument.

In the three items, a typeset PDF document is required or it is the requirement itself.

A.5.1 Figures

This document contains figures that have been made by `xfig`. Post-process the figures to enable inclusion in this document.

The list of figures to be included:

⟨ *parameters in Makefile* 22a ⟩ ≡

```

◇
Fragment defined by 20ae, 22ab, 24c, 26c, 29d.
Fragment referenced in 20b.
Defines: `FIGFILES` 22b, 26c.

We use the package `figlatex` to include the pictures. This package expects two files with extensions `.pdftex` and `.pdftex_t` for `pdflatex` and two files with extensions `.pstex` and `.pstex_t` for the `latex/dvips` combination. Probably tex4ht uses the latter two formats too.

Make lists of the graphical files that have to be present for latex/pdflatex:

⟨ *parameters in Makefile* 22b ⟩ ≡
```
FIGFILENAMES=$(foreach fil,$(FIGFILES), $(fil).fig)
PDFT_NAMES=$(foreach fil,$(FIGFILES), $(fil).pdftex_t)
PDF_FIG_NAMES=$(foreach fil,$(FIGFILES), $(fil).pdftex)
PST_NAMES=$(foreach fil,$(FIGFILES), $(fil).pstex_t)
PS_FIG_NAMES=$(foreach fil,$(FIGFILES), $(fil).pstex)

A.5.2 Bibliography

To keep this document portable, create a portable bibliography file. It works as follows: This document refers in the |bibliography| statement to the local `bib`-file `dutch-nlp-modules-on-Lisa.bib`. To create this file, copy the auxiliary file to another file `auxfil.aux`, but replace the argument of the command `\bibdata{dutch-nlp-modules-on-Lisa}` to the names of the bibliography files that contain the actual references (they should exist on the computer on which you try this). This procedure should only be performed on the computer of the author. Therefore, it is dependent of a binary file on his computer.

⟨ *expliciete make regels* 23a ⟩ ≡

print : dutch-nlp-modules-on-Lisa.pdf
        lpr dutch-nlp-modules-on-Lisa.pdf

Defines: `pdf` 20de, 24a, `print` 9c, 13a, 21a, `view` Never used.

Create the PDF document. This may involve multiple runs of nuweb, the LaTeX processor and the bibTeX processor, and depends on the state of the `aux` file that the LaTeX processor creates as a by-product. Therefore, this is performed in a separate script, `w2pdf`.

The w2pdf script The three processors nuweb, LaTeX and bibTeX are intertwined. LaTeX and bibTeX create parameters or change the value of parameters, and write them in an auxiliary file. The other processors may need those values to produce the correct output. The LaTeX processor may even need the parameters in a second run. Therefore, consider the creation of the (PDF) document finished when none of the processors causes the auxiliary file to change. This is performed by a shell script `w2pdf`.

Note, that in the following `make` construct, the implicit rule `.w.pdf` is not used. It turned out, that make did not calculate the dependencies correctly when I did use this rule.

⟨ *impliciete make regels* 24a ⟩ ≡
```
%.pdf : %.w $(W2PDF)  $(PDF_FIG_NAMES) $(PDFT_NAMES)

Repeat to copy the auxiliary file and the index file and run the processors until the auxiliary file and the index file are equal to their copies. However, since I have not yet been able to test the `aux` file and the `idx` in the same test statement, currently only the `aux` file is tested.

It turns out, that sometimes a strange loop occurs in which the `aux` file will keep to change. Therefore, with a counter we prevent the loop to occur more than 10 times.

A.5.4 Create HTML files

HTML is easier to read on-line than a PDF document that was made for printing. We use `tex4ht` to generate HTML code. An advantage of this system is, that we can include figures in the same way as we do for `pdflatex`.

Nuweb creates a LaTeX file that is suitable for `latex2html` if the source file has `.hw` as suffix instead of `.w`. However, this feature is not compatible with tex4ht.

When the compilation has been satisfied, run makeindex in a special way, run bibtex again (I don't know why this is necessary) and then run htlatex another time.

⟨ *run tex4ht* 29c ⟩ ≡

create the program sources Run nuweb, but suppress the creation of the LaTeX documentation. Nuweb creates only sources that do not yet exist or that have been modified. Therefore make does not have to check this. However, "make" has to create the directories for the sources if they do not yet exist. So, let's create the directories first.
