# Bilingual NLP pipeline

## Paul Huygen <paul.huygen@huygen.nl>

23rd June 2017 15:22 h.

## ${\bf Abstract}$

This is a description and documentation of the installation of the Newsreader-pipeline  $^1$ . It is an instrument to annotate Dutch or English documents with NLP tags. The documents have to be stored in Newsreader Annotation Format (NAF [1]).

## 1 Introduction

This document describes the installation of a pipeline that annotates texts in order to extract knowledge. The pipeline has been set up as part of the newsreader <sup>2</sup> project. It accepts and produces texts in the NAF (Newsreader Annotation Format) format.

Apart from describing the pipeline set-up, the document actually constructs the pipeline. The pipeline has been installed on a (Ubuntu) Linux computer.

The installation has been parameterised. The locations and names that you read (and that will be used to build the pipeline) have been read from variables in file inst.m4 in the nuweb directory.

The installed pipeline is bi-lingual. It is capable to annotate Dutch and English texts. It recognizes the language from the "lang" attribute of the NAF element of the document. Some of the modules are specific for a single language, other modules support both languages. s a result, there must be two pathways to lead a document through the pipeline, one for English and one for Dutch.

The pipeline is a concatenation of independent software modules, each of which reads a NAF document from standard input and produces another NAF document on standard output.

The aim is, to install the pipeline from open-source modules that can e.g. be obtained from Github. However, that aim is only partially fulfilled. Some of the modules still contain elements that are

<sup>2.</sup> http://www.newsreader-project.eu

not open-source of data that are not freely available. Because of lack of time, the current version of the installer installs the English pipeline from a frozen repository of the Newsreader Project.

The NLPP pipeline can be seen as contructed in three parts: 1) The software that is needed to run the pipeline, e.g. compilers and interpreters; 2) the modules themselves and 3) scripts to to make the modules operate on a document.

#### 1.1 Modules of the pipeline

Table 2 lists the modules in the pipeline. The column *source* indicates the origin of the module. The modules are obtained in one of the following ways:

- 1. If possible, the module is directly obtained from an open-source repository like Github.
- 2. Some modules have not been officially published in a repository. These modules have been packed in a tar-ball that can be obtained by the author. In table 2 this has been indicated as SNAPSHOT.

The modules themselves use other utilities like dependency-taggers and POS taggers. These utilities are listed in table 1.

Module	Version	Section	Source
KafNafParserPy	Feb 1, 2015	??	Github
Alpino	21088	??	RUG
Ticcutils	0.7	??	ILK
Timbl	6.4.6	??	ILK
Treetagger	3.2	??	Uni. München
Spotlight server	0.7	??	Spotlight

Table 1: List of the utilities to be installed. Column description: **directory**: Name of the subdirectory below mod in which it is installed; **Source**: From where the module has been obtained; **script**: Script to be included in a pipeline.

## 1.2 Reproducibility

An important goal of this pipeline is, to achieve reproducibility. It mean, that at some point in the future the annotation could be re-done on the document and it should produce a result that is identical as the result of the original annotation. In our casem reproducibility ivolves the following aspects:

- The annotated document ought to contain documentation about the annotation process: What modules have been applied, what was the version of the software of each module, Which resources have been used and what was the version of the resources.
- The source code of the modules as well as resources like data-sets and programming languages should be available from open repository.
- The repositories of the resources should use some versioning system enabling to re-use the version that has been used originally.

A problem in some cases is, that we need to use utilities that are supplied by external parties, and we do not have control about their methods of publication and version management. Examples of such utilities are the compilers for programming languages like Java, Python and parsers like Alpino.

Therefore, we have the following policy to achieve reproducibility:

- Each of the modules writes in the output NAF its own version, and details about the used resources in sufficient detail to enable re-processing.
- It is assumed that when a programming language (e.g. Java, Python) is used, annotion can be reproducible when the major versions coincide.

Table 2: List of the modules to be installed. Column description: directory: Name of the subdirectory below subdirectory modules in which it is installed; source: From where the module has been obtained; commit: Commit-name or version-tag script: Script to be included in a pipeline.

• A script is constructed that reproducibly builds an environment for the pipeline on some software/hardware platform (e.g. Linux on X64 CPU), using utilities that vave been stored in some non-open repository (to preclude copyright-problems).

## 2 Structure of the pipeline

The finished pipeline consists of:

- A directory that contains for each module an directory with the module in installed form.
- A script that reads an input naf file or plain text file from standard in and produces an annotated NAF file on standard out.
- A script that must be "sourced" in order to find the resources that the modules need to find.

The directory with the modules must be relocatable and immutable. That means that scripts in modules do not have write permissions on the module directory and that they have to find other files on path-descriptions relative to the current path of the script itself.

### 2.1 Expected resources

In order to run the modules expect the following:

- Instruction java invokes Java 1.8;
- Instruction python invokes Python 3.6;
- Instruction Perl invokes Perl 5;
- Variable TMPDIR points to a user-writable directory.

## 3 Construct the infra-structure

In this section we will generate a script that set up an infra-structure in which the pipeline can be exploited. An attempt is made to make as little as possible presumptions about the services that the host provides.

We need to set up the following:

- Java Version 1.8
- Maven (Gradle?)
- Python version 3.6
- Python packages
- Autoconf
- ...

Let us generate a script to do the work:

```
"../env/bin/make_infrastructure" 5a\( \text{#!/bin/bash} \\ \langle get location of the script (5b DIR ) 29a \rangle cd $DIR \\ source \cdots \cdot / \cdots / \cdots \cdo
```

Let us also make a script that cleans up the infra-structure after the installation.

```
"../env/bin/clean_infrastructure" 6b\(\equiv \frac{#!}{\text{bin/bash}}\)
\( \langle get location of the script (6c DIR ) 29a \rangle \)
\( \text{cd $DIR} \)
\( \source \cdots / \cdots / \text{progenv} \rangle init make_infrastructure 6f, \cdots \rangle \rangle \cdot \cdot \cdots \rangle \text{clean up after installation 12g} \rangle \rangle \rangle \)
\( \langle \text{make scripts executable 6d} \rangle \equiv \text{chmod 775 .../env/bin/clean_infrastructure} \rangle \)
\( \text{Fragment defined by 6ad, 15a, 22a, 24b, 41c.} \)
\( \text{Fragment referenced in 41d.} \)
```

Before we begin, we can try whether commands that we need to use actually exist and stop execution otherwise.

```
\langle test \ presence \ of \ command \ 6e \rangle \equiv
        which @1 >/dev/null
        if
           [ $? -ne 0 ]
        then
           echo "Please install @1"
           exit 4
        fi
Fragment referenced in 6f.
Uses: install 42a.
\langle init \; make\_infrastructure \; 6f \rangle \equiv
        ⟨ test presence of command (6g git ) 6e⟩
        \langle test \ presence \ of \ command \ (6h \ tar \ ) \ 6e \rangle
        \langle test \ presence \ of \ command \ (6i \ unzip ) \ 6e \rangle
        ⟨ test presence of command (6j tcsh ) 6e⟩
        ⟨ test presence of command (6k hg ) 6e⟩
Fragment defined by 6f, 9b.
Fragment referenced in 5a, 6b.
```

## 3.1 File-structure

Let us set up the pipeline in a directory-structure that looks like figure 1. The directories have the following functions.

3.1 File-structure 7

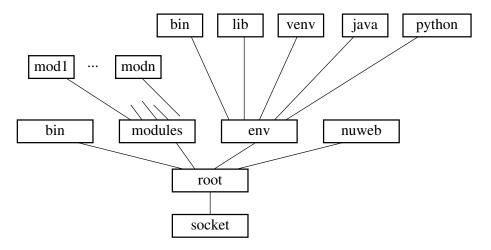

Figure 1: Directory-structure of the pipeline (see text).

**socket:** The directory in the host where the pipeline is to be implemented.

**root:** The root of the pipeline directory-structure.

**nuweb:** This directory contains this document and everything to create the pipeline from the open sources of the modules.

modules: Contains subdirectories with the NLP modules that can be applied in the pipeline.

bin: Contains for each of the applicable modules a script that reads NAF input, passes it to the module in the modules directory and produces the output on standard out. Furthermore, the subdirectory contains the script install-modules that performs the installation, and a script test that shows that the pipeline works in a trivial case.

env: The programming environment. It contains a.o. the Java development kit, Python, the Python virtual environment (venv), libraries and binaries.

```
\langle directories to create 7a \rangle \equiv
        ../modules ⋄
Fragment defined by 7abcd, 36b.
Fragment referenced in 41b.
\langle directories to create 7b \rangle \equiv
        ../bin ../env/bin \diamond
Fragment defined by 7abcd, 36b.
Fragment referenced in 41b.
\langle directories \ to \ create \ 7c \rangle \equiv
        ../env/lib ◊
Fragment defined by 7abcd, 36b.
Fragment referenced in 41b.
\langle directories to create 7d \rangle \equiv
        ../env/etc \diamond
Fragment defined by 7abcd, 36b.
Fragment referenced in 41b.
```

It would be great if an installed pipeline could be moved to another directory while it would keep working. We are not yet sure whether this is possible. However, a minimum condition for this to work would be, that the location of the pipeline can be determined at run-time. To achieve this, let us place a script in the root-directory of the pipeline, that can find in run-time the absolute path to itself and that generates variables that point to the other directories.

```
"../progenv" 8a=
       # Source this script
       \langle get\ location\ of\ the\ script\ (8b\ piperoot\ )\ 29a \rangle
       \langle set variables that point to the directory-structure 8e, \dots \rangle
       ⟨ set environment parameters 8c, . . . ⟩
       if
         [ -e "$piperoot/progenvv" ]
       then
         source $piperoot/progenvv
       export progenvset=0
Uses: piperoot 8d.
\langle set \ environment \ parameters \ 8c \rangle \equiv
       export LC_ALL=en_US.UTF-8
       export LANG=en_US.UTF-8
       export LANGUAGE=en_US.UTF-8
Fragment defined by 8c, 21b.
Fragment referenced in 8a.
The full path to the sourced script can be found in variable BASH_SOURCE[0].
\langle find the nlpp root directory 8d \rangle \equiv
       piperoot="$( cd "$( dirname "${BASH_SOURCE[0]}" )" && pwd )"
Fragment never referenced.
Defines: piperoot 8abe, 11e, 14ac, 18b, 19e, 20a, 22b, 28a.
Once we know piperoot, we know the path to the other directories of figure 1.
\langle set variables that point to the directory-structure 8e \rangle \equiv
       export pipesocket=${piperoot%%/nlpp}
       export nuwebdir=$piperoot/nuweb
       export envdir=$piperoot/env
       export envbindir=$envdir/bin
       export envlibdir=$envdir/lib
       export modulesdir=$piperoot/modules
       export pipebin=$piperoot/bin
       export javadir=$envdir/java
       export jarsdir=$javadir/jars
Fragment defined by 8e, 9a, 12f.
Fragment referenced in 8a.
Uses: nuweb 37d, piperoot 8d.
```

Add the environment bin directory to PATH:

3.2 Download resources 9

#### 3.2 Download resources

To enhance speed of the installation we start to download all resources that we can download at the beginning of the installation in a single blow as parallel processes. We park the resources in a directory v4.0.0.0\_nlpp\_resources, located in the directory where the root of NLPP also resides.

```
\langle init\ make\_infrastructure\ 9b\ \rangle \equiv \\ \langle \ download\ everything\ 9c, \dots\ \rangle \\ \text{wait} \\ \diamond \\ \text{Fragment defined by 6f, 9b.} \\ \text{Fragment referenced in 5a, 6b.}
```

Hopefully there will be little to download.

Synchronize with a non-open snapshot-directory if possible. It is only possible if a valid ssh key resides in file nrkey in the directory in which the nlpp root directory resides.

Download other stuff using wget. The following macro downloads a resource into the snapshot-directory if it is not already there.

Fragment referenced in 11f, 16b, 19b.

#### 3.3 Java

We need to have a Java JDK version 1.8 installed. In other words, when we issue the instruction <code>javac -version</code> within the pipeline environment, the response must be something like <code>javac 1.8.0\_131</code>. We assume that if we find a correct Java 1.8, there will also be a proper <code>java</code>. Let us first test whether that is the case. If it is not the case, we can install <code>java</code> if a proper tarball is present in the "snaphot directory".

Let us perform the two tests:

Do we have a proper Java?

Fragment referenced in 11a.

Do we have a tarball to install Java? (in fact, the following macro can be used to check the presence of any tarball in the snapshot directory).

Fragment referenced in 11a, 12b, 13b, 17a.

Now do it:

3.4 Maven 11

```
\langle set up Java 11a \rangle \equiv
         \langle \; check \; presence \; of \; javac \; in \; 1.8 \; (11b \; \texttt{java_OK} \; ) \; \textbf{10a} \; \rangle
            [ ! "$java_OK" == "True" ]
        then
            \langle \mathit{check} \; \mathit{whether} \; \mathit{a} \; \mathit{tarball} \; \mathit{is} \; \mathit{present} \; \mathit{in} \; \mathit{the} \; \mathit{snapshot} \; (11c \; \mathsf{jdk-8u131-linux-x64.tar.gz}, 11d \; \mathsf{tarball\_present} \;) \; 10b \rangle
              [ ! "$tarball_present" == "True" ]
              echo "Please install Java 1.8 JDK"
              exit 4
           fi
           mkdir -p $javadir
           cd $javadir
           tar -xzf $pipesocket/v4.0.0.0_nlpp_resources/jdk-8u131-linux-x64.tar.gz
           ⟨ set up java environment 11e⟩
        fi
Fragment referenced in 5a.
Adapt the PATH variable and set JAVA_HOME. Set these variables in the script that will be sourced
in the running pipeline and set them in this script because we are going to need Java.
```

```
Uses: PATH 9a, piperoot 8d.
```

Fragment referenced in 11a.

 $\langle set \ up \ java \ environment \ 11e \rangle \equiv$ 

## 3.4 Maven

Currently we need version 3.0.5 to compile the Java sources in some of the modules.

echo 'export JAVA\_HOME=\$envdir/java/jdk1.8.0\_131' >> \$piperoot/progenvv

echo 'export PATH=\$JAVA\_HOME/bin:\$PATH' >> \$piperoot/progenvv

export JAVA\_HOME=\$envdir/java/jdk1.8.0\_131

export PATH=\$JAVA\_HOME/bin:\$PATH

#### 3.5 Mayen

Some Java-based modules can best be compiled with Maven. So download and install Maven:

First check whether maven is already present in the correct version.

```
\langle check \ presence \ of \ maven \ in \ 3.0.5 \ 12a \rangle \equiv
       mvn -version | grep "Maven 3.0.5" >/dev/null
      if
         [ $? == 0 ]
       then
         @1="True"
       else
         @1="False"
      fi
       \Diamond
Fragment referenced in 12b.
\langle set up Maven 12b \rangle \equiv
       \langle check presence of maven in 3.0.5 (12c mvn_OK ) 12a\rangle
         [ ! "$mvn_OK" == "True" ]
         < check whether a tarball is present in the snapshot (12d apache-maven-3.0.5-bin.tar.gz,12e tarball_present ) 10</pre>
         if
            [ ! "$tarball_present" == "True" ]
         then
            echo "Please install Maven version 3.0.5"
            exit 4
         fi
         cd $envdir
         tar -xzf /home/huygen/projecten/pipelines/v4.0.0.0_nlpp_resources/apache-maven-
       3.0.5-bin.tar.gz
         export MAVEN_HOME=$envdir/apache-maven-3.0.5
         export PATH=${MAVEN_HOME}/bin:${PATH}
      fi
Fragment referenced in 5a.
\langle set variables that point to the directory-structure 12f\rangle \equiv
       export MAVEN_HOME=$envdir/apache-maven-3.0.5
       export PATH=${MAVEN_HOME}/bin:${PATH}
Fragment defined by 8e, 9a, 12f.
Fragment referenced in 8a.
Uses: PATH 9a.
When the installation has been finished, we do not need maven anymore.
\langle clean \ up \ after \ installation \ 12g \rangle \equiv
      cd $envdir
      rm -rf apache-maven-3.0.5
Fragment referenced in 6b.
```

3.6 Python 13

#### 3.6 Python

Several modules in the pipeline run on Python version 3.6. If the command python does not invoke that version, we can try install ActivePython, of which we have a tarball in the snapshot. Versioning in Python is very confusing. It is the official Python policy that /usr/bin/env python points to Python version 2 but that scripts with a shabang of #<!!>! /usr/bin/env python should be executable by Python version 2 as well as Python version 3.

Our policy will be as follows:

1. When installing, make sure that command python3 starts a python 3.6 executable. If this is not the case, install ActivePython version 3.6. 2. Generate a virtual environment. 3. Make sure that in our environmen command python executes python from the virtual environment.

```
\langle check \ presence \ of \ python3 \ in \ 3.6 \ 13a \rangle \equiv
       python3 --version 2>&1 | grep "Python 3.6" >/dev/null
         [ $? == 0 ]
       then
         @1="True"
       else
         @1="False"
       fi
Fragment referenced in 13b.
\langle set \ up \ Python \ 13b \rangle \equiv
       ⟨ check presence of python3 in 3.6 (13c python_OK ) 13a⟩
         [ ! "$python_OK" == "True" ]
       then
         (check whether a tarball is present in the snapshot (13d ActivePython-3.6.0.3600-linux-x86_64-glibc-2.3.6-40:
         if
            [ ! "$tarball_present" == "True" ]
         then
            echo "Please install Python version 3.6"
            exit 4
         fi
         ⟨ install ActivePython 14a⟩
       fi
Fragment defined by 13b, 16a.
Fragment referenced in 5a.
```

Unpack the tarball in a temporary directory and install active python in the env subdirectory of nlpp. Active python has a few peculiarities:

- It installs things in subdirectories bin and lib of the installation-directory (in our case subdirectory env).
- It installs scripts with names python3 and pip3. We will make symbolic links from these scripts to python resp. pip.
- It writes self-starting scripts with a "shabang" containing the full absolute path to the python3 script. In an attempt to make Active-python relocatable we will rewrite the Shabangs to have them contain #!/usr/bin/env python.

```
\langle install\ ActivePython\ 14a \rangle \equiv
      pytinsdir='mktemp -d -t activepyt.XXXXXX'
      cd $pytinsdir
      tar -xzf $pipesocket/v4.0.0.0_nlpp_resources/ActivePython-3.6.0.3600-linux-x86_64-
      glibc-2.3.6-401834.tar.gz
      acdir='ls -1'
      cd $acdir
       ./install.sh -I $envdir
      cd $piperoot
      rm -rf $pytinsdir
      ⟨ create python script and pip script 14b⟩
      ⟨ rewrite ActivePython shabangs 14c ⟩
Fragment referenced in 13b.
Uses: install 42a, piperoot 8d.
\langle create\ python\ script\ and\ pip\ script\ 14b \rangle \equiv
      cd $envbindir
      rm python
      ln -s python3 python
      rm pip
      ln -s pip3 pip
Fragment referenced in 14a.
```

To rewrite the shabangs of the ActivePython scripts do as follows:

- 1. Create a temporary directory.
- 2. Generate an AWK script that replaces the shabang line with a correct one.
- 3. Generate a script that moves a script from env/bin to the temporary directory and then applies the AWK script.
- 4. Apply the generated script on the scripts in env/bin.

3.6 Python 15

The following looks complicated. The find command applies the file command on the files in the env/bin directory. The grep command filters out the names of the files that are scripts. it produces a filename, followed by a colon, followed by a description of the type of the file. The gawk command prints the filenames only and the xargs command applies the tran script on the file.

## 3.6.1 Python packages

In order to be reproducible, we must make sure that Python packages are installed in the correct version. Therefore, we will install the packages beforehand and do not leave that to the install-scripts of the modules. Descriptions of the packages can be found on https://pypi.python.org. Install the following packages:

package	version	$\mathbf{module}$
KafNafParserPy	1.87	
lxml	3.8.0	
pyyaml	3.12	
requests	2.18.1	networkx
networkx	1.11	corefbase

```
⟨ set up Python 16a⟩ ≡
    pip install KafNafParserPy==1.87
    pip install lxml==3.8.0
    pip install networkx==1.11
    pip install pyyaml==3.12
    pip install requests==2.18.1
    pip install six==1.10.0.
    ⋄
Fragment defined by 13b, 16a.
Fragment referenced in 5a.
Uses: install 42a.
```

#### 3.7 Perl

One of the modules uses perl and needs XML::LibXML. However, installation of that package seems to be tricky and seems to depend on the availability of obscure stuff. So, we proceed as follows. First test whether Perl version 5 is present on the host. If that is not the case, check whether we have a tarball named 20160520\_nlpp\_perllib.tgz in the snapshot. If that is the case, install Perl from scratch and unpack the tarball. Otherwise, fail, and tell the user to install Perl and XML::LibXML.

Install Perl locally, to be certain that Perl is available and to enable to install packages that we need (in any case: XML::LibXML).

3.7 Perl 17

```
\langle set up Perl 17a \rangle \equiv
        \langle check \ presence \ of \ perl \ in \ 5 \ (17b \ perl_OK) \ 16e \rangle
           [ "$perl_OK" == "True" ]
        then
           \langle check \ whether \ XML::LibXML \ is \ installed \ (17c \ lib_OK \ ) \ 17f \rangle
              [ ! "$lib_OK" == "True" ]
              perl_OK="False"
          fi
        fi
        if
           [ ! "$perl_OK" == "True" ]
        then
           \langle \ check \ whether \ a \ tarball \ is \ present \ in \ the \ snapshot \ (17d \ 20160520\_nlpp\_perllib.tgz,17e \ tarball\_present \ ) \ 10b \ \rangle
           if
              [ ! "$tarball_present" == "True" ]
           then
              echo "Please install Perl version 3.6 and XML::LXML"
              exit 4

      tar -xzf $pipesocket/v4.0.0.0_nlpp_resources/20160520_nlpp_perllib.tgz
Fragment defined by 18abc.
Fragment referenced in 17a.
```

#### 3.8 Download materials

This installer needs to download a lot from different sources:

- Most of the NLP-modules will be built up from their sources in Github. The sources must be cloned.
- Many modules need external resources, e.g. the Alpino tagger. Often these utilities must be downloaded from a location specified by the supplier.
- Many modules use extra resources like model-data, that must be obtained separately.
- Some of the resources are not publicly available. They must be obtained from a pass-word protected URL.

Usually downloads are slow, and the duration is only little determined by the resources in the installing computer, but by the network and the performance of the systems from which we download. Therefore, we may speed up by first downloading things, if possible in parallel processes.

We put the following the beginning of the install-script:

```
\langle \ download \ everything \ 19a \rangle \equiv \\ \langle \ download \ stuff \ 11f, \dots \ \rangle \\ \text{echo Waiting for downloads to complete} \ \dots \\ \text{wait} \\ \text{echo Download completed} \\ \diamond \\ \text{Fragment defined by 9c, 19a.} \\ \text{Fragment referenced in 9b.}
```

## 4 Shared libraries

When we do not want to rely on what the host can present to us, we need to make our own shared libraries. For the present, we will generate the shared libraries libxslt and libxml2. We do the following:

- 1. install autoconf, needed to compile the libs.
- 2. install libxslt
- 3. install libxml2

Uses: install 42a, piperoot 8d.

#### 4.1 Autoconf

Gnu autoconf is a system to help configure the Makefiles for a software package. Softwarepackages that use this, supply a file configure, configure.in or configure.ac. To compile and install a package from source we can then perform 1) ./configure --prefix=<environment>; 2) make; 3) make install.

```
Get autoconf:
\langle download \ stuff \ 19b \rangle \equiv
       ⟨ need to wget (19c autoconf-2.69.tar.gz,19d http://ftp.gnu.org/gnu/autoconf/autoconf-2.69.tar.gz ) 9d ⟩
Fragment defined by 11f, 16b, 19b.
Fragment referenced in 19a.
Install autoconf:
\langle set \ up \ autoconf \ 19e \rangle \equiv
       autoconfdir='mktemp -d -t autoconf.XXXXXX'
       cd $autoconfdir
       tar -xzf $pipesocket/v4.0.0.0_nlpp_resources/autoconf-2.69.tar.gz
       cd autoconf-2.69
       ./configure --prefix=$envdir
       make
       make install
       cd $piperoot
       rm -rf $autoconfdir
Fragment referenced in 5a.
```

4 SHARED LIBRARIES

#### 4.2 libxml2 and libxslt

Compilation and installation of libxml2 and libxslt goes similar, according to the following template:

```
\langle install \ libxml2 \ or \ libxslt \ 20a \rangle \equiv
        shtmpdir='mktemp -d -t shl.XXXXXX'
        cd $shtmpdir
        git clone @1
        packagedir='ls -1'
        cd $packagedir
        ./autogen.sh --prefix=$envdir
       make
       make install
        cd $piperoot
        rm -rf $shtmpdir
Fragment referenced in 20b.
Uses: install 42a, piperoot 8d.
\langle install \ shared \ libs \ 20b \rangle \equiv
        \langle install \; libxml2 \; or \; libxslt \; (20c \; git://git.gnome.org/libxml2 \;) \; 20a \rangle
        \( install libxml2 or libxslt (20d git://git.gnome.org/libxslt ) 20a \)
```

Fragment referenced in 5a.

## 4.3 Alpino

Install Alpino as a utility because it is so big, and hard to install on different platforms. Users may choose to install the utilities (and Alpino) by hand and then still install the modules with the script from this file.

Alpino cannot be obtained from an open source repository and there does not seem to be a repository where all the older versions are stored. Therefore, if possible, we will use a copy from our secret archive if that is available. If that is not available, we will download the latest version of Alpino.

```
\langle install \ Alpino \ 21a \rangle \equiv
      alpinosrc=Alpino-x86_64-Linux-glibc-2.19-21088-sicstus.tar.gz
      cd $envdir
      if
      [ -d "Alpino" ]
      then
        echo "Not installing Alpino, because of existing directory $envdir/Alpino"
      else
           [ ! -e "$pipesocket/v4.0.0.0_nlpp_resources/$alpinosrc" ]
        then
           echo "Try to install the latest Alpino."
           alpinosrc=latest.tar.gz
           cd $pipesocket/v4.0.0.0_nlpp_resources
           wget http://www.let.rug.nl/vannoord/alp/Alpino/versions/binary/latest.tar.gz
             [ $? -gt 0 ]
           then
             echo "Cannot install Alpino. Please install Alpino in $envdir/Alpino"
           fi
        fi
        cd $envdir
        tar -xzf $pipesocket/v4.0.0.0_nlpp_resources/$alpinosrc
      fi
Fragment referenced in 5a.
Uses: install 42a.
\langle set environment parameters 21b \rangle \equiv
      export ALPINO_HOME=$envdir/Alpino
Fragment defined by 8c, 21b.
Fragment referenced in 8a.
Defines: ALPINO_HOME Never used.
```

## 5 Installation of the modules

#### 6 Install the modules

We make a separate script to install the modules. By default, the modules will be installed in subdirectory modules of the NLPP root directory, but this is not necessarily so.

The script install-modules installs modules that are not yet present.

```
"../env/bin/install-modules" 21c≡
#!/bin/bash
⟨ get location of the script (21d DIR ) 29a⟩
cd $DIR
source ../../progenv
⟨ functions of the module-installer 22b⟩
⟨ install the modules 23d, ...⟩
```

Installing a module from Github is very simple:

- Skip installation if the module is already present. Otherwise:
- Clone the module in subdirectory modules.
- cd to that module and perform script install.

```
\langle functions \ of \ the \ module-installer \ 22b \rangle \equiv
       function gitinst (){
          url=$1
          dir=$2
          commitset=$3
          echo "Install $dir" >&2
          cd $piperoot/modules
          if
             [ -e $dir ]
          then
             echo "Not installing existing module $dir"
          else
             git clone $url
             cd $dir
             git checkout $commitset
             ./install
      }
       \Diamond
Fragment referenced in 21c.
Uses: install 42a, piperoot 8d.
```

#### 6.1 Parameters in module-scripts

Some modules need parameters. All modules need a language specification. The language can be passed as exported variable naflang, but it can also be passed as argument -1. Furthermore, some modules need contact with a Spotlight server. With the arguments -h and -b the host and port of a running Spotlight-server can be passed.

The code to obtain command-line arguments in Bash has been obtained from Stackoverflow. The following fragment reads the arguments -l language, -h spotlighthost and -p spotlightport:

```
 \langle \, start \,\, of \,\, module\text{-}script \,\, 22c \, \rangle \equiv \\ \langle \,\, get \,\, location \,\, of \,\, the \,\, script \,\, (22d \,\, DIR \,\,) \,\, 29a \, \rangle \\ \text{cd } \,\, \$ DIR \\ \text{source } \ldots / \ldots / \text{progenv} \\ \diamond
```

Fragment referenced in 23beh.

#### 6.1.1 Tokeniser

The tokenizer is the simples of the modules. It needs Java version 1.8. On installation it compiles a Java JAR file, and this is used in the run script.

```
\langle install \ the \ tokenizer \ 23a \rangle \equiv
       gitinst https://github.com/PaulHuygen/ixa-pipe-tok.git ixa-pipe-
       tok 1a69dbbf337aaf7a97bd21dffcfdbd7cb8ab0d83
Fragment never referenced.
"../bin/tok" 23b=
       ⟨ start of module-script (23c $jarsdir ) 22c ⟩
       cat | ../modules/ixa-pipe-tok/run
6.1.2 Topic detection tool.
The topic detection tool uses Java.
\langle install \ the \ modules \ 23d \rangle \equiv
       gitinst https://github.com/PaulHuygen/ixa-pipe-topic.git ixa-pipe-
       topic b2e0ef60badacd90b4f489bdf45f56a1956eb43e
Fragment defined by 23dg.
Fragment referenced in 21c.

       \langle start \ of \ module - script \ (23f \ jarsdir \ ) \ 22c \rangle
       cat | ../modules/ixa-pipe-topic/run
```

#### 6.1.3 Morphosyntactic Parser and Alpino

The morphosyntactic parser is in fact a wrapper around Alpino. We have installed Alpino in section ??. The morpho-syntactic parser expects Alpino to be located in \$envdir/Alpino.

24 7 UTILITIES

## 7 Utilities

## 7.1 Language detection

The following script ../env/bin/langdetect.py discerns the language of the NAF document that it reads from standard in. If it cannot find the language, it prints unknown. The macro set the language variable uses this script to set variable naflang. All pipeline modules expect that this veriable has been set.

```
"../env/bin/langdetect.py" 24a \equiv
      #!/usr/bin/env python
      # langdetect -- Detect the language of a NAF document.
      import xml.etree.ElementTree as ET
      import sys
      import re
      xmldoc = sys.stdin.read()
      #print xmldoc
      root = ET.fromstring(xmldoc)
      # print root.attrib['lang']
      lang = "unknown"
      for k in root.attrib:
         if re.match(".*lang$", k):
            language = root.attrib[k]
      print(language)
Uses: print 35b.
\langle make\ scripts\ executable\ 24b \rangle \equiv
      chmod 775 ../env/bin/langdetect.py
Fragment defined by 6ad, 15a, 22a, 24b, 41c.
Fragment referenced in 41d.
```

The module-scripts depend on the existence of variable naflang. In most cases this is not a problem because the scripts run in a surrounding script that sets naflang. However, a users may occasionally run a module-script stand-alone e.g. to debug. In that case, we can read the language from the NAF, set variable naflang, and then run the module-script in a subshell. We assume that variable scriptpath contains the path of the script itself.

The macro does the following if naflang has not been set:

- 1. Save the content of standard in to a temporary file.
- 2. Run langdetect with the temporary file as input and set the naflang variable.
- 3. Run the script \$scriptpath (i.e. itself) with the temporary file as input.
- 4. Remove the temporary file.
- 5. Exit itself with the errorcode of the sub-script that it has run.

```
\langle run \ in \ subshell \ when \ naflang \ is \ not \ known \ 25a \rangle \equiv
          [ -z "${naflang+x}" ]
       then
          naffile='mktemp -t naf.XXXXXX'
          cat >$naffile
          naflang='cat $naffile | python $envbindir/langdetect.py'
          export naflang
          cat $naffile | $scriptpath
          result=$?
          rm $naffile
          exit $result
       fi
       \Diamond
Fragment never referenced.
Uses: naflang 27a.
\langle run \ only \ if \ language \ is \ English \ or \ Dutch \ 25b \rangle \equiv
          [ ! "$naflang" == "nl" ] && [ ! "$naflang" == "en" ]
       then
          exit 6
       fi
Fragment never referenced.
Uses: naflang 27a.
```

#### 7.2 Run-script and test-script

The script nlpp reads a NAF document from standard in and produces an annotated NAF on standard out. The script test annotates either a test-document that resides in the nuweb directory or a user-provided document and leaves the intermediate results in its working directory nlpp/test, so that, in case of problems, it is easy traceable what went wrong.

The annotion process involves a sequence in which an NLP module reads a file that contains the output from a previous module (or the input NAF file), processes it and writes the result in another file.

The following function, runmodule, performs the action of a single module in the sequence. It needs three arguments: 1) the name of the NAF file that the previous module produced or the input file; 2) the name of directory in which the module resides and 3) the name of the output NAF.

The function uses variable moduleresult to decide whether it is really going to annotate. If this variable is "false" (i.e., not equal to zero), this means that one of the previous modules failed, and it is of no use to process the input file. In that case, the function leaves moderesult as it is and does not process the input-file. Otherwise, it will process the input-file and it sets moduleresult to the result of the processing module.

26 7 UTILITIES

```
\langle function \ to \ run \ a \ module \ 26a \rangle \equiv
      export moduleresult=0
      function runmodule {
         local infile=$1
         local modulecommand=$modulesdir/$2/run
         local outfile=$3
           [ $moduleresult -eq 0 ]
         then
           cat $infile | $modulecommand > $outfile
           moduleresult=$?
             [ $moduleresult -gt 0 ]
           then
             failmodule=$modulecommand
             echo "Failed: module $modulecommand; result $moduleresult" >&2
             exit $moduleresult
              echo "Completed: module $modulecommand; result $moduleresult" >&2
           fi
        fi
      }
Fragment referenced in 28ab.
Defines: moduleresult 28ab, runmodule 26bc, 27a.
Use the function to annotate a NAF file that infile points to and write the result in a file that
outfile points to:
\langle annotate \ dutch \ document \ 26b \rangle \equiv
      runmodule $infile
                              ixa-pipe-tok
                                                    tok.naf
      runmodule tok.naf
                               ixa-pipe-topic
                                                       $outfile
Fragment never referenced.
Uses: runmodule 26a.
Similar for an English naf:
\langle annotate\ english\ document\ 26c \rangle \equiv
         runmodule $infile
                               ixa-pipe-tok
                                                      tok.naf
         runmodule tok.naf
                                 ixa-pipe-topic
                                                          $outfile
```

Determine the language and select one of the above macro's to annotate the document. In fact, consider the document as an English document unless naflang is "nl"

Fragment referenced in 27a. Uses: runmodule 26a.

Uses: naflang 27a.

```
\langle annotate 27a \rangle \equiv
      naflang='cat $infile | /home/huygen/projecten/pipelines/nlpp/env/bin/langdetect.py'
      export naflang
      if
       [ "$naflang" == "nl" ]
      then
      runmodule $infile
                              ixa-pipe-tok
                                                    tok.naf
      runmodule tok.naf
                               ixa-pipe-topic
                                                       top.naf
      runmodule top.naf
                               morphosyntactic_parser_nl
                                                                   $outfile
         ⟨ annotate english document 26c ⟩
      fi
Fragment referenced in 28ab.
Defines: naflang 25ab, 27b.
Uses: runmodule 26a.
```

Use the above "annotate" macro in a test script and in a run script. The scripts set a working directory and put the input-file in it, and then annotate it.

The test-script uses a special test-directory and leaves it behind when it is finished. If the user specified a language, the script copies a NAF testfile from the nuweb directory as input-file. Otherwise, the script expects the test-directory to be present, with an input-file (named in.naf) in it.

```
\langle get \ a \ testfile \ and \ set \ naflang \ or \ die \ 27b \rangle \equiv
      cd $workdir
      naflang=""
      if
         [ "$1" == "en" ]
         cp $nuwebdir/test.en.in.naf $infile
         export naflang="en"
      else
         if
           [ "$1" == "n1" ]
         then
           cp $nuwebdir/test.nl.in.naf $infile
           export naflang="nl"
         fi
      fi
      if
         [ -e $infile ]
      then
         if
           [ "$naflang" == "" ]
         then
           naflang='cat $infile | python $envbindir/langdetect.py'
         fi
       else
         echo "Please supply test-file $workdir/$infile or specify language"
      fi
      \Diamond

       workdir=$piperoot/test
       mkdir -p $workdir
       cd $workdir
       infile=in.naf
       outfile=out.naf
       ⟨ get a testfile and set naflang or die 27b⟩
       ⟨function to run a module 26a⟩
       \langle annotate 27a \rangle
         [ $moduleresult -eq 0 ]
       then
         echo Test succeeded.
       else
         echo Something went wrong.
       exit $moduleresult
Uses: moduleresult 26a, piperoot 8d.
```

The run-script nlpp reads a "raw" naf from standard in and produces an annotated naf on standard out. It creates a temporary directory to store intermediate results from the modules and removes this directory afterwards.

```
"../bin/nlpp" 28b=
       #!/bin/bash
        oldd='pwd'
        workdir='mktemp -d -t nlpp.XXXXXX'
        cd $workdir
        cat >$workdir/$infile
        \langle \mathit{function} \ \mathit{to} \ \mathit{run} \ \mathit{a} \ \mathit{module} \ 26a \, \rangle
        ⟨ annotate 27a ⟩
        if
           [ $moduleresult -eq 0 ]
        then
          cat $outfile
        fi
        cd $oldd
        rm -rf $workdir
        exit $moduleresult
Uses: moduleresult 26a.
```

## 8 Miscellaneous

## 8.1 Locate the path to the script itself

The following macro finds the directory in which the script itself or the sourced script itself is located.

8.2 Logging 29

```
\label{eq:continuous} $$ \langle \mbox{ get location of the script 29a} \rangle \equiv $$ @1="$( \mbox{ cd "$( dirname "${BASH_SOURCE[0]}" )" && pwd)"} $$ $$ $$ $$ $$ Fragment referenced in 5a, 6b, 8a, 14f, 21c, 22c.
```

#### 8.2 Logging

Write log messages to standard out if variable LOGLEVEL is equal to 1.

```
\langle \ variables \ of \ install-modules \ 29b \ \rangle \equiv \\ \ LOGLEVEL=1 \\ \diamond \\ \ Fragment \ never \ referenced. \langle \ logmess \ 29c \ \rangle \equiv \\ \ if \\ \ [\ \$LOGLEVEL \ -gt \ 0 \ ] \\ \ then \\ \ echo \ @1 \\ \ fi
```

Fragment never referenced.

#### A How to read and translate this document

This document is an example of *literate programming* [2]. It contains the code of all sorts of scripts and programs, combined with explaining texts. In this document the literate programming tool nuweb is used, that is currently available from Sourceforge (URL:nuweb.sourceforge.net). The advantages of Nuweb are, that it can be used for every programming language and scripting language, that it can contain multiple program sources and that it is very simple.

#### A.1 Read this document

The document contains *code scraps* that are collected into output files. An output file (e.g. output.fil) shows up in the text as follows:

```
"output.fil" 4a \equiv
# output.fil
< a macro 4b >
< another macro 4c >
```

The above construction contains text for the file. It is labelled with a code (in this case 4a) The constructions between the < and > brackets are macro's, placeholders for texts that can be found in other places of the document. The test for a macro is found in constructions that look like:

```
< a macro 4b>\equiv This is a scrap of code inside the macro. It is concatenated with other scraps inside the macro. The concatenated scraps replace the invocation of the macro.
```

```
Macro defined by 4b, 87e
Macro referenced in 4a
Macro's can be defined on different places. They can contain other macro's.

< a scrap 87e > \equiv

This is another scrap in the macro. It is concatenated to the text of scrap 4b.

This scrap contains another macro:

< another macro 45b >

Macro defined by 4b, 87e
Macro referenced in 4a
```

#### A.2 Process the document

The raw document is named a\_nlpp.w. Figure 2 shows pathways to translate it into print-

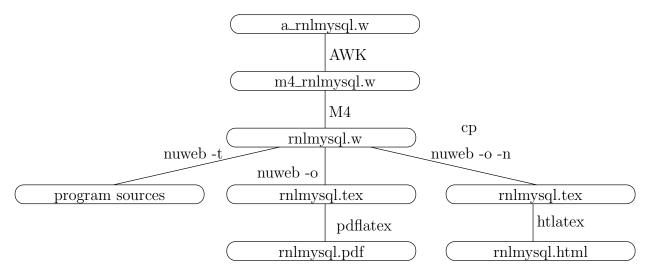

Figure 2: Translation of the raw code of this document into printable/viewable documents and into program sources. The figure shows the pathways and the main files involved.

able/viewable documents and to extract the program sources. Table 3 lists the tools that are

$\mathbf{Tool}$	Source	Description
gawk	www.gnu.org/software/gawk/	text-processing scripting language
M4	www.gnu.org/software/m4/	Gnu macro processor
nuweb	nuweb.sourceforge.net	Literate programming tool
tex	www.ctan.org	Typesetting system
tex4ht	www.ctan.org	Convert TEX documents into xml/html

Table 3: Tools to translate this document into readable code and to extract the program sources

needed for a translation. Most of the tools (except Nuweb) are available on a well-equipped Linux system.

```
\langle \ parameters \ in \ Makefile \ 31a \rangle \equiv $$ NUWEB=../env/bin/nuweb $$ $$ $$ $$ Fragment defined by 31a, 32a, 34ab, 36c, 38b, 41a. Fragment referenced in 31b. Uses: nuweb 37d.
```

## A.3 The Makefile for this project.

This chapter assembles the Makefile for this project.

```
"Makefile" 31b \equiv
        \langle default target 31c \rangle
        ⟨ parameters in Makefile 31a, . . . ⟩
         ⟨ impliciete make regels 34c, ... ⟩
         \langle explicite make regels 32b, \dots \rangle
         \langle make \ targets \ 31d, \dots \rangle
The default target of make is all.
\langle default target 31c \rangle \equiv
        all : \langle all \ targets \ 31e \rangle
         .PHONY : all
        \Diamond
Fragment referenced in 31b.
Defines: all Never used, PHONY 35a.
\langle make \ targets \ 31d \rangle \equiv
        clean:
                     ../env/bin/clean_infrastructure
Fragment defined by 31d, 35b, 36a, 39c, 41bd, 42abc.
Fragment referenced in 31b.
The default is, to install nlpp.
\langle all \ targets \ 31e \rangle \equiv
        \mathtt{install} \diamond
Fragment referenced in 31c.
Uses: install 42a.
```

We use many suffixes that were not known by the C-programmers who constructed the make utility. Add these suffixes to the list.

#### A.4 Get Nuweb

An annoying problem is, that this program uses nuweb, a utility that is seldom installed on a computer. Therefore, we are going to install that first if it is not present. Unfortunately, nuweb is hosted on sourceforge and it is difficult to achieve automatic downloading from that repository. Therefore I copied one of the versions on a location from where it can be downloaded with a script.

Put the nuweb binary in the nuweb subdirectory, so that it can be used before the directory-structure has been generated.

```
\langle explicite make regels 32b \rangle \equiv
       nuweb: $(NUWEB)
       $(NUWEB): ../nuweb-1.58
                 mkdir -p ../env/bin
                 cd ../nuweb-1.58 && make nuweb
                 cp ../nuweb-1.58/nuweb $(NUWEB)
Fragment defined by 32bd, 33ab, 35a, 36d, 38c, 39b.
Fragment referenced in 31b.
Uses: nuweb 37d.
\langle\; clean\; up\; 32c\; \rangle \equiv
       rm -rf ../nuweb-1.58
Fragment never referenced.
Uses: nuweb 37d.
\langle explicite make regels 32d \rangle \equiv
       ../nuweb-1.58:
                 cd .. && wget http://kyoto.let.vu.nl/~huygen/nuweb-1.58.tgz
                 cd .. && tar -xzf nuweb-1.58.tgz
Fragment defined by 32bd, 33ab, 35a, 36d, 38c, 39b.
Fragment referenced in 31b.
Uses: nuweb 37d.
```

## A.5 Pre-processing

To make usable things from the raw input  $a_npp.w$ , do the following:

- 1. Process \$ characters.
- 2. Run the m4 pre-processor.
- 3. Run nuweb.

This results in a LATEX file, that can be converted into a PDF or a HTML document, and in the program sources and scripts.

## A.5.1 Process 'dollar' characters

Many "intelligent"  $T_EX$  editors (e.g. the auctex utility of Emacs) handle \$ characters as special, to switch into mathematics mode. This is irritating in program texts, that often contain \$ characters as well. Therefore, we make a stub, that translates the two-character sequence \\$ into the single \$ character.

## A.6 Typeset this document

Enable the following:

- 1. Create a PDF document.
- 2. Print the typeset document.
- 3. View the typeset document with a viewer.
- 4. Create a htmldocument.

In the three items, a typeset PDF document is required or it is the requirement itself.

## A.6.1 Figures

This document contains figures that have been made by xfig. Post-process the figures to enable inclusion in this document.

The list of figures to be included:

```
\langle parameters in Makefile 34a \rangle \equiv
       FIGFILES=fileschema directorystructure
Fragment defined by 31a, 32a, 34ab, 36c, 38b, 41a.
Fragment referenced in 31b.
Defines: FIGFILES 34b.
```

We use the package figlatex to include the pictures. This package expects two files with extensions .pdftex and .pdftex\_t for pdflatex and two files with extensions .pstex and .pstex\_t for the latex/dvips combination. Probably tex4ht uses the latter two formats too.

```
Make lists of the graphical files that have to be present for latex/pdflatex:
\langle parameters in Makefile 34b \rangle \equiv
      FIGFILENAMES=$(foreach fil, $(FIGFILES), $(fil).fig)
      PDFT_NAMES=$(foreach fil,$(FIGFILES), $(fil).pdftex_t)
      PDF_FIG_NAMES=$(foreach fil,$(FIGFILES), $(fil).pdftex)
      PST_NAMES=$(foreach fil, $(FIGFILES), $(fil).pstex_t)
      PS_FIG_NAMES=$(foreach fil, $(FIGFILES), $(fil).pstex)
Fragment defined by 31a, 32a, 34ab, 36c, 38b, 41a.
Fragment referenced in 31b.
Defines: FIGFILENAMES Never used, PDFT_NAMES 36a, PDF_FIG_NAMES 36a, PST_NAMES Never used,
      PS_FIG_NAMES Never used.
Uses: FIGFILES 34a.
Create the graph files with program fig2dev:
\langle impliciete\ make\ regels\ 34c\,\rangle \equiv
      %.eps: %.fig
               fig2dev -L eps $< > $@
      %.pstex: %.fig
               fig2dev -L pstex $< > $@
       .PRECIOUS : %.pstex
      %.pstex_t: %.fig %.pstex
               fig2dev -L pstex_t -p $*.pstex $< > $@
      %.pdftex: %.fig
               fig2dev -L pdftex $< > $@
       .PRECIOUS : %.pdftex
      %.pdftex_t: %.fig %.pstex
               fig2dev -L pdftex_t -p $*.pdftex $< > $@
Fragment defined by 34c, 39a.
```

Fragment referenced in 31b. Defines: fig2dev Never used.  $\langle explicite make regels 35a \rangle \equiv$ 

.PHONY : bibfile

#### A.6.2 Bibliography

To keep this document portable, create a portable bibliography file. It works as follows: This document refers in the |bibliography| statement to the local bib-file nlpp.bib. To create this file, copy the auxiliary file to another file auxfil.aux, but replace the argument of the command \bibdata{nlpp} to the names of the bibliography files that contain the actual references (they should exist on the computer on which you try this). This procedure should only be performed on the computer of the author. Therefore, it is dependent of a binary file on his computer.

```
Fragment defined by 32bd, 33ab, 35a, 36d, 38c, 39b.
Fragment referenced in 31b.
Uses: PHONY 31c.

A.6.3 Create a printable/viewable document

Make a PDF document for printing and viewing.

\( \langle \text{ make targets } 35b \rangle \equiv \text{ pdf } : nlpp.pdf

\quad \text{ print : nlpp.pdf}

\quad \text{ print : nlpp.pdf}

\quad \text{ view : nlpp.pdf}

\quad \text{ view : nlpp.pdf}

\quad \text{ view : nlpp.pdf}

\quad \text{ prince nlpp.pdf}

\quad \text{ Fragment defined by 31d, 35b, 36a, 39c, 41bd, 42abc.}

Fragment referenced in 31b.
```

Defines: pdf 32a, 36a, print 15bc, 24a, 33a, view Never used.

bibfile : nlpp.aux /home/paul/bin/mkportbib

/home/paul/bin/mkportbib nlpp litprog

Create the PDF document. This may involve multiple runs of nuweb, the IATEX processor and the bibTEX processor, and depends on the state of the aux file that the IATEX processor creates as a by-product. Therefore, this is performed in a separate script, w2pdf.

The w2pdf script The three processors nuweb, LATEX and bibTEX are intertwined. LATEX and bibTEX create parameters or change the value of parameters, and write them in an auxiliary file. The other processors may need those values to produce the correct output. The LATEX processor may even need the parameters in a second run. Therefore, consider the creation of the (PDF) document finished when none of the processors causes the auxiliary file to change. This is performed by a shell script w2pdf.

The following is an ugly fix of an unsolved problem. Currently I develop this thing, while it resides on a remote computer that is connected via the sshfs filesystem. On my home computer I cannot run executables on this system, but on my work-computer I can. Therefore, place the following script on a local directory.

```
\langle directories to create 36b \rangle \equiv
       ../nuweb/bin ⋄
Fragment defined by 7abcd, 36b.
Fragment referenced in 41b.
Uses: nuweb 37d.
\langle parameters \ in \ Makefile \ 36c \rangle \equiv
       W2PDF=../nuweb/bin/w2pdf
Fragment defined by 31a, 32a, 34ab, 36c, 38b, 41a.
Fragment referenced in 31b.
Uses: nuweb 37d.
\langle explicite make regels 36d \rangle \equiv
       $(W2PDF) : nlpp.w $(NUWEB)
                 $(NUWEB) nlpp.w
Fragment defined by 32bd, 33ab, 35a, 36d, 38c, 39b.
Fragment referenced in 31b.
"../nuweb/bin/w2pdf" 36e\equiv
       #!/bin/bash
       # w2pdf -- compile a nuweb file
       # usage: w2pdf [filename]
       # 20170623 at 1522h: Generated by nuweb from a_nlpp.w
       NUWEB=../env/bin/nuweb
       LATEXCOMPILER=pdflatex
       ⟨ filenames in nuweb compile script 37b ⟩
       ⟨ compile nuweb 37a ⟩
Uses: nuweb 37d.
```

The script retains a copy of the latest version of the auxiliary file. Then it runs the four processors nuweb, LATEX, MakeIndex and bibTEX, until they do not change the auxiliary file or the index.

```
\label{eq:compile_nuweb_37a} $\left\langle$ compile nuweb \ 37a\right\rangle$ \equiv $$NUWEB=/home/huygen/projecten/pipelines/nlpp/env/bin/nuweb $\left\langle$ run \ the \ processors \ until \ the \ aux \ file \ remains \ unchanged \ 38a\right\rangle$ $\left\langle$ remove \ the \ copy \ of \ the \ aux \ file \ 37c\right\rangle$ $$$$$$$$$$$ Fragment referenced in 36e. Uses: nuweb 37d.
```

The user provides the name of the nuweb file as argument. Strip the extension (e.g. .w) from the filename and create the names of the IATEX file (ends with .tex), the auxiliary file (ends with .aux) and the copy of the auxiliary file (add old. as a prefix to the auxiliary filename).

```
\langle filenames in nuweb compile script 37b \rangle \equiv
       nufil=$1
       trunk=${1\%.*}
       texfil=${trunk}.tex
       auxfil=${trunk}.aux
       oldaux=old.${trunk}.aux
       indexfil=${trunk}.idx
       oldindexfil=old.${trunk}.idx
Fragment referenced in 36e.
Defines: auxfil 38a, 40ab, indexfil 38a, 40a, nufil 37d, 40ac, oldaux 37c, 38a, 40ab, oldindexfil 38a, 40a,
       texfil 37d, 40ac, trunk 37d, 40acd.
Remove the old copy if it is no longer needed.
\langle remove the copy of the aux file 37c\rangle \equiv
       rm $oldaux
Fragment referenced in 37a, 39e.
Uses: oldaux 37b, 40a.
```

Run the three processors. Do not use the option -o (to suppres generation of program sources) for nuweb, because w2pdf must be kept up to date as well.

```
⟨ run the three processors 37d ⟩ ≡
    $NUWEB $nufil
    $LATEXCOMPILER $texfil
    makeindex $trunk
    bibtex $trunk
    $\diamoldapprox \text{Fragment referenced in 38a.} \text{Defines: bibtex 40cd, makeindex 40cd, nuweb 8e, 31a, 32bcd, 36bce, 37a, 38b, 39d.} \text{Uses: nufil 37b, 40a, texfil 37b, 40a, trunk 37b, 40a.} \text{
```

Repeat to copy the auxiliary file and the index file and run the processors until the auxiliary file and the index file are equal to their copies. However, since I have not yet been able to test the aux file and the idx in the same test statement, currently only the aux file is tested.

It turns out, that sometimes a strange loop occurs in which the aux file will keep to change. Therefore, with a counter we prevent the loop to occur more than 10 times.

```
\langle run \ the \ processors \ until \ the \ aux \ file \ remains \ unchanged \ 38a \rangle \equiv
       LOOPCOUNTER=0
       while
         ! cmp -s $auxfil $oldaux
       do
         if [ -e $auxfil ]
         then
          cp $auxfil $oldaux
         fi
         if [ -e $indexfil ]
         then
          cp $indexfil $oldindexfil
         fi
         ⟨ run the three processors 37d ⟩
         if [ $LOOPCOUNTER -ge 10 ]
         then
           cp $auxfil $oldaux
         fi;
       done
Fragment referenced in 37a.
Uses: auxfil 37b, 40a, indexfil 37b, oldaux 37b, 40a, oldindexfil 37b.
```

#### A.6.4 Create HTML files

HTML is easier to read on-line than a PDF document that was made for printing. We use tex4ht to generate HTML code. An advantage of this system is, that we can include figures in the same way as we do for pdflatex.

To create a HTML doc, we do the following:

- 1. Create a directory ../nuweb/html for the HTML document.
- 2. Put the nuweb source in it, together with style-files that are needed (see variable HTML-SOURCE).
- 3. Put the script w2html in it and make it executable.
- 4. Execute the script w2html.

Make a list of the entities that we mentioned above:

```
⟨ parameters in Makefile 38b⟩ ≡
    htmldir=../nuweb/html
    htmlsource=nlpp.w nlpp.bib html.sty artikel3.4ht w2html
    htmlmaterial=$(foreach fil, $(htmlsource), $(htmldir)/$(fil))
    htmltarget=$(htmldir)/nlpp.html
    ⋄
Fragment defined by 31a, 32a, 34ab, 36c, 38b, 41a.
Fragment referenced in 31b.
Uses: nuweb 37d.

Make the directory:
⟨ explicite make regels 38c⟩ ≡
    $(htmldir) :
        mkdir -p $(htmldir)
    ⋄
Fragment defined by 32bd, 33ab, 35a, 36d, 38c, 39b.
Fragment referenced in 31b.
```

```
The rule to copy files in it:
\langle impliciete\ make\ regels\ 39a \rangle \equiv
       $(htmldir)/\( '\) : % $(htmldir)
                cp $< $(htmldir)/</pre>
Fragment defined by 34c, 39a.
Fragment referenced in 31b.
Do the work:
\langle explicite make regels 39b \rangle \equiv
       $(htmltarget) : $(htmlmaterial) $(htmldir)
                cd $(htmldir) && chmod 775 w2html
                cd $(htmldir) && ./w2html nlpp.w
Fragment defined by 32bd, 33ab, 35a, 36d, 38c, 39b.
Fragment referenced in 31b.
Invoke:
\langle make \ targets \ 39c \rangle \equiv
      htm : $(htmldir) $(htmltarget)
Fragment defined by 31d, 35b, 36a, 39c, 41bd, 42abc.
Fragment referenced in 31b.
Create a script that performs the translation.
"w2html" 39d≡
      #!/bin/bash
       # w2html -- make a html file from a nuweb file
       # usage: w2html [filename]
       # [filename]: Name of the nuweb source file.
       # 20170623 at 1522h: Generated by nuweb from a_nlpp.w
       echo "translate " $1 >w2html.log
       NUWEB=/home/huygen/projecten/pipelines/nlpp/env/bin/nuweb
       ⟨ filenames in w2html 40a ⟩
       \langle perform the task of w2html 39e \rangle
       \Diamond
Uses: nuweb 37d.
```

The script is very much like the w2pdf script, but at this moment I have still difficulties to compile the source smoothly into HTML and that is why I make a separate file and do not recycle parts from the other file. However, the file works similar.

```
\label{eq:continuous} \begin{array}{l} \langle \mbox{ perform the task of w2html 39e} \rangle \equiv \\ & \langle \mbox{ run the html processors until the aux file remains unchanged 40b} \rangle \\ & \langle \mbox{ remove the copy of the aux file 37c} \rangle \\ & \Diamond \\ \end{array} Fragment referenced in 39d.
```

The user provides the name of the nuweb file as argument. Strip the extension (e.g. .w) from the filename and create the names of the LATEX file (ends with .tex), the auxiliary file (ends with .aux) and the copy of the auxiliary file (add old. as a prefix to the auxiliary filename).

```
\langle filenames in w2html 40a \rangle \equiv
       nufil=$1
       trunk=${1\\\.*}
       texfil=${trunk}.tex
       auxfil=${trunk}.aux
       oldaux=old.${trunk}.aux
       indexfil=${trunk}.idx
       oldindexfil=old.${trunk}.idx
Fragment referenced in 39d.
Defines: auxfil 37b, 38a, 40b, nufil 37bd, 40c, oldaux 37bc, 38a, 40b, texfil 37bd, 40c, trunk 37bd, 40cd.
Uses: indexfil 37b, oldindexfil 37b.
\langle run \ the \ html \ processors \ until \ the \ aux \ file \ remains \ unchanged \ 40b \rangle \equiv
         ! cmp -s $auxfil $oldaux
       do
         if [ -e $auxfil ]
         then
          cp $auxfil $oldaux
         fi
         ⟨ run the html processors 40c ⟩
       done
       \langle run \ tex4ht \ 40d \rangle
Fragment referenced in 39e.
Uses: auxfil 37b, 40a, oldaux 37b, 40a.
To work for HTML, nuweb must be run with the -n option, because there are no page numbers.
\langle run \ the \ html \ processors \ 40c \rangle \equiv
       $NUWEB -o -n $nufil
       latex $texfil
       makeindex $trunk
       bibtex $trunk
       htlatex $trunk
Fragment referenced in 40b.
Uses: \verb|bibtex| 37d, \verb|makeindex| 37d, \verb|nufil| 37b, 40a, \verb|texfil| 37b, 40a, \verb|trunk| 37b, 40a.|
When the compilation has been satisfied, run makeindex in a special way, run bibtex again (I don't
know why this is necessary) and then run htlatex another time.
       tex '\def\filename{{nlpp}{idx}{4dx}{ind}} \input idxmake.4ht'
       makeindex -o $trunk.ind $trunk.4dx
       bibtex $trunk
```

htlatex \$trunk

Fragment referenced in 40b.

Uses: bibtex 37d, makeindex 37d, trunk 37b, 40a.

#### A.7 Perform the installation

Run nuweb, but suppress the creation of the LATEX documentation. Nuweb creates only sources that do not yet exist or that have been modified. Therefore make does not have to check this. However, "make" has to create the directories for the sources if they do not yet exist. So, let's create the directories first.

```
\langle parameters in Makefile 41a \rangle \equiv

Fragment referenced in 41d.
```

The target "sources" unpacks the nuweb file and creates the program scripts, i.e. the scripts that will apply modules on a NAF file and the script <code>install\_modules</code> that installs the modules themselves and that creates the software environment the the modules need.

The "install" target performs the complete installation.

#### A.8 Test whether it works

The targets testnl and testen perform the test-script (section ??) to test the dutch resp. english pipeline.

## A.9 Restore paths after transplantation

When an existing installation has been transplanted to another location, many path indications have to be adapted to the new situation. The scripts that are generated by nuweb can be repaired by re-running nuweb. After that, configuration files of some modules must be modified.
