Bilingual NLP pipeline

Paul Huygen <paul.huygen@huygen.nl>

$\begin{array}{c} 18 th \ February \ 2016 \\ 10:54 \ h. \end{array}$

${\bf Abstract}$

This is a description and documentation of the installation of an instrument to annotate Dutch or English documents with NLP tags.

1 Introduction

This document describes the current set-up of a pipeline that annotates texts in order to extract knowledge. The pipeline has been set up by the Computational Lexicology an Terminology Lab (CLTL ¹) as part of the newsreader ² project. It accepts and produces texts in the NAF (Newsreader Annotation Format) format.

Apart from describing the pipeline set-up, the document actually constructs the pipeline. The pipeline has been installed on a (Ubuntu) Linux computer.

The installation has been parameterised. The locations and names that you read (and that will be used to build the pipeline) have been read from variables in file inst.m4 in the nuweb directory.

The pipeline is bi-lingual. It is capable to annotate Dutch and English texts. It recognizes the language from the "lang" attribute of the NAF element of the document.

The aim is, to install the pipeline from open-source modules that can e.g. be obtained from Github. However, that aim is only partially fulfilled. Some of the modules still contain elements that are not open-source of data that are not freely available. Because of lack of time, the current version of the installer installs the English pipeline from a frozen repository of the Newsreader Project.

1.1 List of the modules to be installed

Table 1 lists the modules that are installed. Some of the modules are used for both languages (Dutch and English), some for only one of them.

Table 2 lists the modules in the pipeline. The column *source* indicates the origin of the module. The modules are obtained in one of the following ways:

- 1. If possible, the module is directly obtained from an open-source repository like Github.
- 2. Some modules have not been officially published in a repository. These modules have been packed in a tar-ball that can be obtained by the author. In table 2 this has been indicated as SNAPSHOT.

The modules themselves use other utilities like dependency-taggers and POS taggers. These utilities are listed in table 3.

1.2 The things that are not open-source yet

The aim is, that the pipeline-system is completely open-sourced, so that anybody can install it from sources like Github. Howver, a lot of elements are not yet open-sourced, but need private kludges. The following is a list of not-yet open things.

Table 3: List of the modules to be installed. Column description: **directory**: Name of the subdirectory below mod in which it is installed; **Source**: From where the module has been obtained; **script**: Script to be included in a pipeline.

1.3 Multi-linguality

Thi version of the pipeline is multi-lingual, i.e. it can annotate Dtutsch as well as English documents. It finds the language of the document in the language attribute of the NAF element. Actually, the current version is bi-lingual, because it is only able to process Dutch or English documents.

1.4 File-structure of the pipeline

The files that make up the pipeline are organised in set of directories as shown in figure 1. The

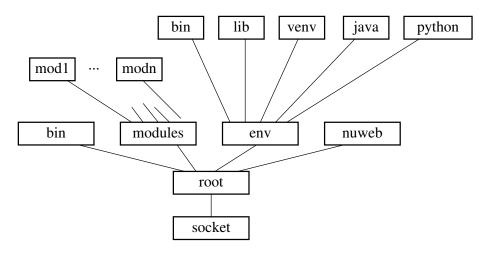

Figure 1: Directory-structure of the pipeline (see text).

directories have the follosing functions.

socket: The directory in the host where the pipeline is to be implemented.

root: The root of the pipeline directory-structure.

nuweb: This directory contains this document and everything to create the pipeline from the open sources of the modules.

modules: Contains subdirectories with the NLP modules that can be applied in the pipeline.

bin: Contains for each of the applicable modules a script that reads NAF input, passes it to the module in the modules directory and produces the output on standard out. Furthermore, the subdirectory contains the script install-modules that performs the installation, and a script test that shows that the pipeline works in a trivial case.

env: The programming environment. It contains a.o. the Java development kit, Python, the Python virtual environment (venv), libraries and binaries.

6 1 INTRODUCTION

```
\langle directories \ to \ create \ 4a \rangle \equiv
         ../modules ⋄
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
\langle directories to create 4b \rangle \equiv
         ../bin ../env/bin ⋄
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
\langle directories to create 4c \rangle \equiv
         ../env/lib <
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
\langle directories \ to \ create \ 4d \rangle \equiv
         ../env/etc \diamond
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
```

The following macro defines variable piperoot and makes it to point to the root directory in figure 1. Next it defines variables that point to other directories in the figure. The value-setting of piperoot can be overruled by defining the variable before running any of the script. In this way the directory tree can be moved to another location, even to another computer, after successful installation.

```
\langle set variables that point to the directory-structure 4e \rangle \equiv
         [ "$piperoot" == "" ]
       then
         export piperoot=/home/phuijgen/nlp/test/nlpp
       export pipesocket=${piperoot%%/nlpp}
       export nuwebdir=$piperoot/nuweb
       export envdir=$piperoot/env
       export envbindir=$envdir/bin
       export envlibdir=$envdir/lib
       export modulesdir=$piperoot/modules
       export pipebin=$piperoot/bin
       export javadir=$envdir/java
       export jarsdir=$javadir/jars
Fragment defined by 4e, 5a, 7a, 9c.
Fragment referenced in 5b, 15a, 71.
Uses: nuweb 66b.
```

Add the environment bin directory to PATH:

```
⟨ set variables that point to the directory-structure 5a⟩ ≡
export PATH=$envbindir:$PATH

⟨>
Fragment defined by 4e, 5a, 7a, 9c.
Fragment referenced in 5b, 15a, 71.
Defines: PATH 8g, 9c, 10a, 41a, 55a.
```

Put the macro to set variables in a script that can later be sourced by the scripts of the pipeline modules.

```
"../env/bin/progenv" 5b\(\equiv \frac{\pm !!}{\pm lin}\phash\)
\( \lambda \text{ variables that point to the directory-structure 4e, \ldots \rightarrow \text{export progenvset=0} \rightarrow \text{File defined by 5b, 8a.}
```

2 How to obtain modules and other material

As illustrated in tables 2 and 3, most of the modules are obtained as source-code from Github, some of the modules or parts of some modules are downloaded from a snapshot, and some of the utilities are obtained in binary form from the supplier.

This section builds standardised methods to obtain modules and utilities from Github or from the snapshot.

2.1 Location-dependency

The basic way of installation is, to clone this repository from Github on the intended location in the file-system of the target computer and then run the install-scripts. However, it may be advantageous to be able to transplant a complete installation to another location in another computer. This could be done by making all path-descriptions in all scripts relative to anchorpoints within the installation, while it may be hard to find such anchorpoints in advance. Therefore, we take another approach in which we supply a script that repairs paths-descriptions after the transplantation (section A.8).

2.2 Reversible update

This script might be used to update an existing installation. To minimize the risk that the "update" acually ruins an existing installation, move existing modules away before installing the latest version. When the new modules has been installed successfully, the moved module will be removed. The following macro's help to achieve this:

```
\langle \ remove \ old \ module \ 6a \rangle \equiv \\ rm \ -rf \ old.@1 \\ \diamond Fragment referenced in 6d, 13a, 57c.  \langle \ re\text{-}instate \ old \ module \ 6b \rangle \equiv \\ mv \ old.@1 \ @1 \\ MESS="Replaced previous version of @1" \\ \langle \ logmess \ (6c \ MESS \ ) \ 57b \rangle   \diamond  Fragment referenced in 6d, 13a, 57c.
```

2.3 Installation from Github

The following macro can be used to install a module from Github. Before issuing this macro, the following four variables must be set:

 $\mathbf{MODNAM}:$ Name of the module.

DIRN: Name of the root directory of the module.

GITU: Github URL to clone from.

GITC: Github commit-name or version tag.

```
⟨install from github 6d⟩ ≡
    cd $modulesdir
    ⟨move module (6e $DIRN ) 5c⟩
    git clone $GITU
    if
        [ $? -gt 0 ]
    then
        ⟨logmess (6f Cannot install current $MODNAM version ) 57b⟩
        ⟨re-instate old module (6g $DIRN ) 6b⟩
    else
        ⟨remove old module (6h $DIRN ) 6a⟩
        cd $modulesdir/$DIRN
        git checkout $GITC
    fi
```

2.4 Installation from the snapshot

Fragment referenced in 31d, 36c, 41c, 43f, 45c, 48d, 50d, 53a.

The sources for the non-open parts of the pipeline are collected in directory t_nlpp_resources. They can be accessed via SSH from url m4_snapshotURL. Before installing the pipeline download the snapshot on top of directory snapshotsocket.

The snapshot can be accessed over scp on URL newsreader@kyoto.let.vu.nl. Access is protected by a public/private key system. So, a private key is needed and this program expects to to find the key as \$pipesocket/nrkey. The key can be obtained from the author. Let us check whether we indeed do have the key:

```
⟨ check this first 7b⟩ ≡
if
        [! -e $pipesocket/nrkey]
        then
        echo "No key to connect to snapshot!"
        exit 1
        fi
        ◊
Fragment defined by 7b, 19e.
Fragment referenced in 15a.

Update the local snapshot repository.
⟨ get the snapshot 7c⟩ ≡
        cd $snapshotsocket
        rsync -e "ssh -i $HOME/nrkey" -rLt newsreader@kyoto.let.vu.nl:t_nlpp_resources .
        ◊
Fragment referenced in 15a.
```

3 Java and Python environment

To be independent from the software environment of the host computer and to perform reproducible processing, the pipeline features its own Java and Python environment. The costs of this feature are that the pipeline takes more disk-space by reproducing infra-structure that is already present in the system and that installation takes more time.

The following macro generates a script that specifies the programming environment. Initially it is empty, because we have to create the programming environment first.

Cause the module scripts to read the javapython script.

```
"../env/bin/progenv" 8a\equiv source $envbindir/javapython \diamondsuit File defined by 5b,\,8a.
```

3.1 Java

Fragment referenced in 70a.

To install Java, download server-jre-7u72-linux-x64.tar.gz from http://www.oracle.com/technetwork/java/javase/downloads/server-jre7-downloads-1931105.html. Find it in the root directory and unpack it in a subdirectory of envdir.

```
\langle \ directories \ to \ create \ 8b \ \rangle \equiv
                     ../env/java ♦
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
\langle set up java 8c \rangle \equiv
                     \( \begin \) \( \b
                           cd $envdir/java
                           tar -xzf $snapshotsocket/t_nlpp_resources/server-jre-7u72-linux-x64.tar.gz
                     ⟨ end conditional install (8e java_installed ) 14d ⟩
Fragment defined by 8cg.
Fragment referenced in 15a.
Remove the java-ball when cleaning up:
\langle clean \ up \ 8f \rangle \equiv
                    rm -rf $pipesocket/server-jre-7u72-linux-x64.tar.gz
Fragment defined by 8f, 9d, 22b, 61a.
Fragment referenced in 60a.
Set variables for Java.
\langle set up java 8g \rangle \equiv
                     echo 'export JAVA_HOME=$envdir/java/jdk1.7.0_72' >> /home/phuijgen/nlp/test/nlpp/env/bin/javapython
                    echo 'export PATH=$JAVA_HOME/bin:$PATH' >> /home/phuijgen/nlp/test/nlpp/env/bin/javapython
                     export JAVA_HOME=$envdir/java/jdk1.7.0_72
                    export PATH=$JAVA_HOME/bin:$PATH
Fragment defined by 8cg.
Fragment referenced in 15a.
Uses: PATH 5a.
Put jars in the jar subdirectory of the java directory:
\langle directories \ to \ create \ 8h \rangle \equiv
                     ../env/java/jars <
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
```

3.2 Maven 11

3.2 Maven

```
Some Java-based modules can best be compiled with Maven.
```

```
\langle directories to create 9a \rangle \equiv
        ../env/apache-maven-3.0.5 \diamond
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
\langle install \ maven \ 9b \rangle \equiv
        cd $envdir
        wget http://apache.rediris.es/maven/maven-3/3.0.5/binaries/apache-maven-3.0.5-
        bin.tar.gz
        tar -xzf apache-maven-3.0.5-bin.tar.gz
        rm apache-maven-3.0.5-bin.tar.gz
Fragment referenced in 15a.
\langle set variables that point to the directory-structure 9c\rangle \equiv
        export MAVEN_HOME=$envdir/apache-maven-3.0.5
        export PATH=${MAVEN_HOME}/bin:${PATH}
Fragment defined by 4e, 5a, 7a, 9c.
Fragment referenced in 5b, 15a, 71.
Uses: PATH 5a.
When the installation has been done, remove maven, because it is no longer needed.
\langle clean up 9d \rangle \equiv
        rm -rf ../env/apache-maven-3.0.5
        \langle \ remove \ installed \ -variable \ (9e \ {\tt maven\_installed} \ ) \ {\tt 14e} \ \rangle
Fragment defined by 8f, 9d, 22b, 61a.
Fragment referenced in 60a.
```

3.3 Java 1.6

Java 1.7 is able to run nearly all the modules of the pipeline that are based on Java. However, there is one exception, i.e. the ims-wsd module, that needs Java version 1.6. So, we have to install that version of Java as well.

```
 \begin{array}{l} \langle \, install \, Java \, 1.6 \,\, 9f \, \rangle \equiv \\ \qquad \qquad \text{cd } \$envdir/java \\ \qquad \qquad \$snapshotsocket/t\_nlpp\_resources/jre-6u45-linux-x64.bin} \\ \qquad \qquad \diamond \\ \\ \text{Fragment referenced in } \textcolor{red}{15a}. \end{array}
```

Insert the following macro in scripts that need to run Java 1.6.

3.4 Python

Set up the environment for Python (version 2.7). I could not find an easy way to set up Python from scratch. Therefore we wil use Python 2.7 if is has been installed on the host. Otherwise, we will use a binary distribution obtained from ActiveState. A tarball of ActivePython can be obtained from the snapshot.

In order to be independent of the software on the host, we generate a virtual Python environment. In the virtual environment we will install KafNafParserPy and other Python packages that are needed.

```
\langle set \ up \ python \ 10b \rangle \equiv
         \(\bar{check/install the correct version of python 10c}\)
        ⟨ create a virtual environment for Python 11b⟩
         [activate the python environment 11d, ... ]
         update pip 12b >
        ⟨ install kafnafparserpy 13a ⟩
        ⟨ install python packages 13f, ... ⟩
Fragment referenced in 15a.
\langle check/install \ the \ correct \ version \ of \ python \ 10c \rangle \equiv
        pythonok='python --
        version 2>&1 | gawk '{if(match($2, "2.7")) print "yes"; else print "no" }''
          [ "$pythonok" == "no" ]
        then
          ⟨ install ActivePython 11a⟩
        fi
Fragment referenced in 10b.
Defines: pythonok Never used.
Uses: print 64a.
```

Unpack the tarball in a temporary directory and install active python in the env subdirectory of nlpp. It turns out that you must upgrade pip, virtualenv and setuptools after the installation (see https://github.com/ActiveState/activepython-docker/commit/10fff72069e51dbd36330cb8a7c2f0845bcd7b3 and https://github.com/ActiveState/activepython-docker/issues/1).

3.4 Python 13

```
\langle install \ Active Python \ 11a \rangle \equiv
       pytinsdir='mktemp -d -t activepyt.XXXXXX'
       cd $pytinsdir
       tar -xzf $snapshotsocket/t_nlpp_resources/ActivePython-2.7.8.10-linux-x86_64.tar.gz
       acdir='ls -1'
       cd $acdir
       ./install.sh -I $envdir
       cd $piperoot
       rm -rf $pytinsdir
       pip install -U pip virtualenv setuptools
Fragment referenced in 10c.
Uses: virtualenv 11c.
3.4.1 Virtual environment
Create a virtual environment. To begin this, we need the Python module virtualenv on the host.
\langle create \ a \ virtual \ environment \ for \ Python \ 11b \rangle \equiv
        \langle test whether virtualenv is present on the host 11c \rangle
       cd $envdir
       virtualenv venv
Fragment referenced in 10b.
Uses: virtualenv 11c.
\langle test \ whether \ virtualenv \ is \ present \ on \ the \ host \ 11c \rangle \equiv
       which virtualenv
       if
          [ $? -ne 0 ]
       then
          echo Please install virtualenv
          exit 1
       fi
Fragment referenced in 11b.
Defines: virtualenv 11ab.
\langle activate the python environment 11d \rangle \equiv
       source $envdir/venv/bin/activate
       echo 'source $en-
       vdir/venv/bin/activate' >> /home/phuijgen/nlp/test/nlpp/env/bin/javapython
Fragment defined by 11d, 12a.
Fragment referenced in 10b, 15a.
Defines: activate 12c.
Subdirectory $envdir/python will contain general Python packages like KafnafParserPy.
\langle directories to create 11e \rangle \equiv
       ../env/python <
Fragment defined by 4abcd, 8bh, 9a, 11e, 64c.
Fragment referenced in 70a.
```

Activation of Python include pointing to the place where Python packages are:

Update pip in the virtual environment, because otherwise it keeps complaining about outdated versions

```
\langle update \ pip \ 12b \rangle \equiv
pip install --upgrade pip
\diamond
Fragment referenced in 10b.
```

3.4.2 Transplant the virtual environment

It turns out that the script "activate" to engage the virtual environment contains an absolute path, in the definition of VIRTUAL_ENV

```
\langle \ set \ paths \ after \ transplantation \ 12c \, \rangle \equiv
       transdir='mktemp -d -t trans.XXXXXX'
       cd $transdir
       cat <<EOF >redef.awk
       #!/usr/bin/gawk -f
       BEGIN { envd="$envdir/venv"}
       /^VIRTUAL_ENV=/ { print "VIRTUAL_ENV=\"" envd "\""
                           next
       {print}
       EOF
       mv $envdir/venv/bin/activate .
       gawk -f redef.awk ./activate > $envdir/venv/bin/activate
       cd $projroot
       rm -rf $transdir
Fragment referenced in 71.
Uses: activate 11d, print 64a.
```

3.4.3 KafNafParserPy

A cornerstone Pythonmodule for the pipeline is KafNafParserPy. It is a feature of this module that you cannot install it with PIP, but that you can add it to your PYTHONPATH.

```
\langle install \ kafnafparserpy \ 13a \rangle \equiv
        cd $envdir/python
        DIRN=KafNafParserPy
        \langle move \ module \ (13b \ \$DIRN \ ) \ 5c \rangle
        git clone https://github.com/cltl/KafNafParserPy.git
           [ $? -gt 0 ]
           ⟨ logmess (13c Cannot install current $DIRN version ) 57b⟩
           ⟨ re-instate old module (13d $DIRN ) 6b⟩
           \langle \; remove \; old \; module \; (13e \; \$DIRN \;) \; \mathbf{6a} \; \rangle
        fi
        \Diamond
Fragment referenced in 10b.
3.4.4 Python packages
Install python packages:
lxml:
pyyaml: for coreference-graph
\langle install \ python \ packages \ 13f \rangle \equiv
        pip install lxml
        pip install pyyaml
Fragment defined by 13f, 51e.
Fragment referenced in 10b.
Defines: lxml Never used, pyyaml Never used.
```

4 Installation of the modules

This section describes how the modules are obtained from their (open-)source and installed.

4.1 Conditional installation of the modules

Next section generates a script that installs everything.

Installation is very time-intensive. To prevent that everything is re-installed every time that the module-installer is run, there is a list of variables, the *modulelist*, that are set when a module has been installed. To re-install that module, remove the variable from the list and then re-run the installer. It maintains a list of the modules and utilitie that is has installed and installs only modules and utilities that are not on the list. So in order to re-install a module that has already been installed, remove it from the list and then re-run the module-installer.

The modulelist is in fact a script named /home/phuijgen/nlp/test/nlpp/installed_modules that sets Bash variables. It ought to be sourced if it is present.

Initially the list is not present. When a module or a utility has been installed, an instruction to set a variable is written in or appended to the list.

```
\langle read the list of installed modules 14a \rangle \equiv
          [ -e /home/phuijgen/nlp/test/nlpp/installed_modules ]
        then
          source /home/phuijgen/nlp/test/nlpp/installed_modules
        fi
Fragment referenced in 15a.
\langle \ begin \ conditional \ install \ 14b \ \rangle \equiv
        if
          [ ! $@1 ]
        then
Fragment referenced in 8c, 15a, 16aj, 17aj, 18ahq, 19a.
\langle else\ conditional\ install\ 14c \rangle \equiv
        else
        \Diamond
Fragment never referenced.
\langle end \ conditional \ install \ 14d \rangle \equiv
          echo "export @1=0" >> /home/phuijgen/nlp/test/nlpp/installed_modules
        fi
Fragment referenced in 8c, 15a, 16aj, 17aj, 18ahq, 19a.
Remove a variable from the list of installed modules, e.g. after a clean-up.
\langle remove installed-variable 14e \rangle \equiv
        cd $piperoot
        mv /home/phuijgen/nlp/test/nlpp/installed_modules old.modulelist
        cat old.modulelist | gawk '/@1/ {next}; {print}' >/home/phuijgen/nlp/test/nlpp/installed_modules
Fragment referenced in 9d.
Uses: print 64a.
```

4.2 The installation script

The installation is performed by script install-modules.

The first part of the script installs the utilities:

```
"../bin/install-modules" 15a=
         #!/bin/bash
         echo Set up environment
         ⟨ set variables that point to the directory-structure 4e, ... ⟩
         ⟨ read the list of installed modules 14a⟩
         ⟨ check this first 7b, ... ⟩
         \langle begin \ conditional \ install \ (15b \ repo_installed \ ) \ 14b \rangle
           ⟨ get the snapshot 7c ⟩
         ⟨ end conditional install (15c repo_installed ) 14d⟩
         ⟨ variables of install-modules 57a ⟩
         ⟨ create javapython script 7d ⟩
         echo ... Java
         \langle set \ up \ java \ 8c, \dots \rangle
         \langle begin \ conditional \ install \ (15d \ maven_installed \ ) \ 14b \rangle
           ⟨install maven 9b⟩
         ⟨ end conditional install (15e maven_installed ) 14d ⟩
         ⟨ begin conditional install (15f java16_installed ) 14b⟩
           (install Java 1.6 9f)
         ⟨ end conditional install (15g java16_installed ) 14d⟩
        echo ... Python
        if
           [ $python_installed ]
        then
           ⟨ activate the python environment 11d, ... ⟩
        fi
         \langle \ begin \ conditional \ install \ (15h \ python_installed \ ) \ 14b \ \rangle
           ⟨ set up python 10b ⟩
         ⟨ end conditional install (15i python_installed ) 14d⟩
         ⟨ begin conditional install (15j sematree_installed ) 14b⟩
           ⟨ install sematree 20a ⟩
         \langle end \ conditional \ install \ (15k \ sematree\_installed \ ) \ 14d \rangle
        echo ... Alpino
         ⟨ begin conditional install (15l alpino_installed ) 14b⟩
           ⟨ install Alpino 21f⟩
         \langle \ end \ conditional \ install \ (15m \ alpino\_installed \ ) \ 14d \ \rangle
        echo ... Spotlight
         ⟨ begin conditional install (15n spotlight_installed ) 14b⟩
           ⟨ install the Spotlight server 25a, ... ⟩
         ⟨ end conditional install (15o spotlight_installed ) 14d⟩
         echo ... Treetagger
         \langle begin \ conditional \ install \ (15p \ treetagger_installed \ ) \ 14b \rangle
           \langle install \ the \ treetagger \ utility \ 22c, \dots \rangle
         ⟨ end conditional install (15q treetagger_installed ) 14d⟩
         echo ... Ticcutils and Timbl
         \langle begin \ conditional \ install \ (15r \ ticctimbl_installed ) \ 14b \rangle
           (install the ticcutils utility 24a)
           (install the timbl utility 24b)
         \langle end \ conditional \ install \ (15s \ \texttt{ticctimbl\_installed} \ ) \ 14d \ \rangle
         echo ... Boost
         \langle begin \ conditional \ install \ (15t \ boost_installed \ ) \ 14b \rangle
           ⟨ install boost 24e ⟩
         \langle end \ conditional \ install \ (15u \ boost_installed \ ) \ 14d \rangle
        echo ... VUA-pylib, SVMlight, CRFsuite
         \langle \; begin \; conditional \; install \; (15 v \; {\tt miscutils\_installed} \;) \; {\tt 14b} \; \rangle
           ⟨install VUA-pylib 29a⟩
            ⟨install SVMLight 29b⟩
            ⟨ install CRFsuite 30a ⟩
         ⟨ end conditional install (15w miscutils_installed ) 14d⟩
```

Next, install the modules:

```
"../bin/install-modules" 16a\equiv
        echo Install modules
        \langle begin \ conditional \ install \ (16b \ tokenizer_installed \ ) \ 14b \rangle
          echo ... Tokenizer
           ⟨ install the tokenizer 30b ⟩
        ⟨ end conditional install (16c tokenizer_installed ) 14d⟩
        ⟨ begin conditional install (16d topic_installed ) 14b⟩
          echo ... Topic detector
           ⟨ install the topic analyser 31a⟩
        \langle end \ conditional \ install \ (16e \ topic_installed \ ) \ \frac{14d}{} \rangle
        ⟨ begin conditional install (16f morpar_installed ) 14b⟩
          echo ... Morphosyntactic parser
           ⟨ install the morphosyntactic parser 31d ⟩
        ⟨ end conditional install (16g morpar_installed ) 14d⟩
        ⟨ begin conditional install (16h pos_installed ) 14b⟩
          echo "... Pos tagger (for english docs)"
           ⟨ install the pos tagger 32b⟩
        ⟨ end conditional install (16i pos_installed ) 14d⟩
File defined by 15a, 16aj, 17aj, 18ahq, 19a.
"../bin/install-modules" 16j=
        \langle begin \ conditional \ install \ (16k \ constparse\_installed \ ) \ 14b \rangle
          echo "... Constituent parser (for english docs)"
          ⟨ install the constituents parser 32e ⟩
        \langle \; end \; conditional \; install \; (16l \; {\tt constparse\_installed} \;) \; {\tt 14d} \; \rangle
        ⟨ begin conditional install (16m nerc_installed ) 14b⟩

```

4.3 Check availability of resources

Test for some resources that we need and that may not be available on this host.

4.4 Install utilities and resources

4.4.1 Process synchronisation

We will see that we sometimes have to install server-applications. However, it is possible that multiple processes are running pipeline modules in parallel, and then it may occur that two instances of a module try to install the same server-application. Therefore, we must make sure that only one application at a time is able to start the server.

The program sematree, found at http://www.pixelbeat.org/scripts/sematree/ enables to do this. When invoked with argument "acquire", the name of a "lockfile" and a time to wait (-1 means "wait an indefinite time"), it checks whether the lockfile exists. If that is the case, it either waits or fails. When the lockfile is not (or no longer) present, sematree creates the lockfile.

When installing Sematree, set the default directory for lock-files. We set this as a subdirectory of the env tree. However, in some cases, notably when running in a node in Lisa, we need a directory on the filesystem of the node itself.

4.4.2 Prefix of scripts that run modules

Each module will be run by a Bash script located in subdirectory bin. The start of these scrips will have similar content. Insert the following macro to include this similar content, with the name of the module-directory as argument:

```
⟨ start of module-script 20b⟩ ≡
    #!/bin/bash
    source /home/phuijgen/nlp/test/nlpp/env/bin/progenv
    export LC_ALL=en_US.UTF-8
    export LANG=en_US.UTF-8
    export LANGUAGE=en_US.UTF-8
    ROOT=$piperoot
    MODDIR=$modulesdir/@1
    ♦

```

4.4.3 Language detection

The following script ../env/bin/langdetect.py discerns the language of a NAF document. If it cannot find that attribute it prints unknown. The macro set the language variable uses this script to set variable lang. All pipeline modules expect that this veriable has been set.

```
"../env/bin/langdetect.py" 20c=
      #!/usr/bin/env python
      # language of a NAF document.
      import xml.etree.ElementTree as ET
      import sys
      import re
      xmldoc = sys.stdin.read()
      #print xmldoc
      root = ET.fromstring(xmldoc)
      # print root.attrib['lang']
      lang = "unknown"
      for k in root.attrib:
         if re.match(".*lang$", k):
          language = root.attrib[k]
      print language
Uses: print 64a.
```

```

Uses: naflang 21d.
```

4.4.4 Alpino

Binary versions of Alpino can be obtained from the official Alpino website of Gertjan van Noort. However, it seems that older versions are not always retained there, or the location of older versions change. Therefore we have a copy in the snapshot.

Module

Fragment referenced in 15a.

Currently, alpino is not used as a pipeline-module on its own, but it is included in other pipeline-modules. Modules that use Alpino should set the following variables:

Remove the tarball when cleaning up:

```
⟨ clean up 22b⟩ ≡

\langle unpack \ ticcutils \ or \ timbl \ 24c \rangle \equiv
        SUCCES=0
        ticbeldir='mktemp -t -d tickbel.XXXXXX'
        cd $ticbeldir
        tar -xzf $snapshotsocket/t_nlpp_resources/$TARB
        cd $DIR
        ./configure --prefix=$envdir
        make
        make install
        cd $piperoot
        rm -rf $ticbeldir
Fragment referenced in 24ab.
```

When the installation has been transplanted, Timbl and Ticcutils have to be re-installed.

```
\langle re-install modules after the transplantation 24d \rangle \equiv \langle install the ticcutils utility 24a \rangle \langle install the timbl utility 24b \rangle \diamond
```

Fragment referenced in 71.

4.4.7 The Boost library

Theoretically, it is possible to download a tarball with boost from it's repository and then install it. However, I did not succeed in doing this. Therefore, I ripped the installed boost from Surfsara's Hadoop installation and put it in the env dir.

4.4.8 Spotlight

A Spotlight server occupies a lot of memory and we need two of them, one for each language. We may be lucky and have a spotlight server running somewhere. Otherwise we have to install the server ourselves.

Install Spotlight in the way that Itziar Aldabe (mailto:itziar.aldabe@ehu.es) described:

The NED module works for English, Spanish, Dutch and Italian. The module returns multiple candidates and correspondences for all the languages. If you want to integrate it in your Dutch or Italian pipeline, you will need:

- 1. The jar file with the dbpedia-spotlight server. You need the version that Aitor developed in order to correctly use the "candidates" option. You can copy it from the English VM. The jar file name is dbpedia-spotlight-0.7-jar-with-dependencies-candidates.jar
- 2. The Dutch/Italian model for the dbpedia-spotlight. You can download them from: http://spotlight.sztaki.hu/downloads/
- 3. The jar file with the NED module: ixa-pipe-ned-1.0.jar. You can copy it from the English VM too.
- 4. The file: wikipedia-db.v1.tar.gz. You can download it from: http://ixa2.si.ehu.es/ixa-pipes/models/wikipedia-db.v1.tar.gz. This file contains the required information to do the mappings between the wikipedia-entries. The zip file contains three files: wikipedia-db, wikipedia-db.p and wikipedia-db.t

To start the dbpedia server: Italian server:

```
java -jar -Xmx8g dbpedia-spotlight-0.7-jar-with-dependencies-candidates.jar \
   it http://localhost:2050/rest
```

Dutch server:

So, let us do that:

```
java -jar -Xmx8g dbpedia-spotlight-0.7-jar-with-dependencies-candidates.jar nl http://localhost:2
```

We set 8Gb for the English server, but the Italian and Dutch Spotlight will require less memory.

```
\langle install \ the \ Spotlight \ server \ 25a \rangle \equiv
        cd $envdir
        tar -xzf $snapshotsocket/t_nlpp_resources/spotlightnl.tgz
        cd $envdir/spotlight
        \langle \ \textit{get spotlight model ball} \ (25b \ \mathtt{nl.tar.gz} \ ) \ \textcolor{red}{\mathbf{25d}} \rangle

        rm wikipedia-db.v1.tar.gz
Fragment defined by 25a, 26a.
Fragment referenced in 15a.
```

The macro check/start spotlight does the following:

- 1. Check whether spotlight runs on the default spotlighthost.
- 2. If that is not the case, and the defaulthost is not localhost, check whether Spotlight runs on localhost.
- 3. If a running spotlightserver is still not found, start a spotlightserver on localhost.

```
\langle function \ to \ check/start \ spotlight \ 26b \rangle \equiv
       function check_start_spotlight {
         naflang=$1
         ⟨ get spotlight language parameters 26g ⟩
         spotlighthost=130.37.53.38
          ⟨ check listener on host, port (26c $spotlighthost,26d $spotlightport ) 27a⟩
            [ $spotlightrunning -ne 0 ]
         then
            if
              [ ! "$spotlighthost" == "localhost" ]
              export spotlighthost="localhost"
              ⟨ check listener on host, port (26e $spotlighthost,26f $spotlightport ) 27a⟩
            fi
         fi
         if
            [ $spotlightrunning -ne 0 ]
         then
            ⟨ start the Spotlight server on localhost 28b⟩
         fi
         export spotlighthost
          export spotlightrunning
       }
Fragment referenced in 55c.
```

Set the port-number and the language resource for Spotlight, dependent of the language that the user gave as argument.

```
⟨ get spotlight language parameters 26g⟩ ≡
    if
        [ "$naflang" == "nl" ]
    then
        spotlightport=2060
    else
        spotlightport=2020
    fi
        ◊
Fragment referenced in 26b.
Uses: naflang 21d.
```

The following macro has a hostname and a port-number as arguments. It checks whether something in the host listens on the port and sets variable **success** accordingly:

If variable spotlighthost does not exist, set it to localhost. Test whether a Spotlightserver runs on spotlighthost. If that fails and spotlighthost did not point to localhost, try localhost.

If the previous attempts were not succesfull, start the spotlightserver on localhost.

If some spotlightserver has been contacted, set variable spotlightrunning. Otherwise exit. At the end variable spotlighthost ought to contain the address of the Spotlight-host.

```
\langle try to obtain a running spotlightserver 27b \rangle \equiv
       ⟨ test whether spotlighthost runs (27c $spotlighthost ) 28a⟩
          [ ! $spotlightrunning ]
       then
         if
            [ "$spotlighthost" != "localhost" ]
         then
            export spotlighthost=localhost
            ⟨ test whether spotlighthost runs (27d $spotlighthost ) 28a⟩
         fi
       fi
       if
          [ ! $spotlightrunning ]
          ⟨ start the Spotlight server on localhost 28b⟩
          ⟨ test whether spotlighthost runs (27e $spotlighthost ) 28a⟩
       fi
       if
          [ ! $spotlightrunning ]
         echo "Cannot start spotlight"
         exit 4
       fi
```

Test whether the Spotlightserver runs on a given host. The "spotlight-test" does not really test Spotlight, but it tests whether something is listening on the port and host where we expect Spotlight. I found the test-construction that is used here on Stackoverflow. If the test is positive, set variable spotlightrunning to 0. Otherwise, unset that variable.

When trying to start the Spotlight-server on localhost, take care that only one process does this. So we do this:

1. Acquire a lock.

Fragment never referenced.

- 2. Check that in the mean time Spotlight has not been started by another process.
- 3. Run the Spotlight java program if Spotlight does still not run.

release the lock 4. $\langle start \ the \ Spotlight \ server \ on \ localhost \ 28b \rangle \equiv$ ["\$naflang" == "nl"] then spotresource="nl" else spotresource="en_2+2" fi cd /home/phuijgen/nlp/test/nlpp/env/spotlight \$envbindir/sematree acquire spotlock -1 ⟨ check listener on host, port (28c \$spotlighthost,28d \$spotlightport) 27a⟩ if [! \$spotlightrunning -eq 0] java -jar -Xmx8g dbpedia-spotlight-0.7-jar-with-dependenciescandidates.jar \$spotresource http://localhost:\$spotlightport/rest & $\langle \ \mathit{wait until the spotlight server is up 28e} \ \rangle$ \$envbindir/sematree release spotlock Fragment referenced in 26b, 27b. $\langle wait until the spotlight server is up 28e \rangle \equiv$ ⟨ check listener on host, port (28f \$spotlighthost,28g \$spotlightport) 27a⟩ [\$spotlightrunning -ne 0] do sleep 10 done

Start the Spotlight if it is not already running. First find out what the host is on which we may expect to find a listening Spotlight.

Variable spotlighthost contains the address of the host where we expect to find Spotlight. If the expectation does not come true, and the Spotlighthost was not localhost, test whether Spotlight can be found on localhost. If the spotlight-server cannot be found, start it up on localhost.

4.4.9 VUA-pylib

Fragment referenced in 28b.

Module VUA-pylib is needed for the opinion-miner. Install it in the Python library

```
⟨install VUA-pylib 29a⟩ ≡
    cd $envdir/python
    git clone https://github.com/cltl/VUA_pylib.git
```

4.4.10 SVMLight

Fragment referenced in 15a.

SVMlight supplies a Support Vector Machine. It is used by the opinion-miner. SVMlight can be obtained from the site where it is documented.

Installation goes like this:

```
\langle install SVMLight 29b \rangle =
    tempdir='mktemp -d -t SVMlight.XXXXXX'
    cd $tempdir
    wget http://download.joachims.org/svm_light/current/svm_light.tar.gz
    tar -xzf svm_light.tar.gz
    make all
    cp svm_classify /home/phuijgen/nlp/test/nlpp/env/bin/
    cp svm_learn /home/phuijgen/nlp/test/nlpp/env/bin/
    cd /home/phuijgen/nlp/test/nlpp
    rm -rf $tempdir
    \langle
Fragment referenced in 15a.
Uses: all 59c.
```

4.4.11 CRFsuite

CRFsuite is an implementation of Conditional Random Fields (CRF). Module opinion-miner-deluxe needs it. It can be installed from it's sources, but I did not manage to this. Therefore, currently we use a pre-compiled ball.

Fragment referenced in 15a.

4.5 Install modules

4.5.1 Install tokenizer

Module The tokenizer is just a jar that has to be run in Java. Although the jar is directly available from http://ixa2.si.ehu.es/ixa-pipes/download.html, we prefer to compile the package in order to make this thing ready for reproducible set-ups.

To install the tokenizer, we proceed as follows:

- 1. Clone the source from github into a temporary directory.
- 2. Compile to produce the jar file with the tokenizer.
- 3. move the jar file into the jar directory.
- 4. remove the tempdir with the sourcecode.

4.5 Install modules 33

```
\langle install \ the \ tokenizer \ 30b \rangle \equiv
       tempdir='mktemp -d -t tok.XXXXXX'
       cd $tempdir
       git clone https://github.com/ixa-ehu/ixa-pipe-tok.git
       cd ixa-pipe-tok
       git checkout 56f83ce4b61680346f15e5d4e6de6293764f7383
       mvn clean package
       mv target/ixa-pipe-tok-1.8.0.jar $jarsdir
       cd $piperoot
       rm -rf $tempdir
Fragment referenced in 16a.
Script The script runs the tokenizerscript.
"../bin/tok" 30c=
       ⟨ start of module-script (30d $jarsdir ) 20b⟩
       ⟨ abort when the language is not English or Dutch 21e⟩
       JARFILE=$jarsdir/ixa-pipe-tok-1.8.0.jar
       java -Xmx1000m -jar $JARFILE tok -l $naflang --inputkaf
       \Diamond
4.5.2 Topic analyser
The English pipeline contains a topic analyser that seems not yet fit for Dutch. Get it from the
Newsreader repo and update the config file.
\langle install \ the \ topic \ analyser \ 31a \rangle \equiv
       cd $modulesdir
       tar -xzf $snapshotsocket/t_nlpp_resources/20151220_EHU-topic.v30.tgz
       cd $modulesdir/EHU-topic.v30
       mv conf.prop old.conf.prop
       gawk '{gsub("/home/newsreader/components", subs); print}' subs=$modulesdir old.conf.prop >conf.prop
Fragment referenced in 16a.
Uses: print 64a.
Script:
"../bin/topic" 31b\equiv
       \langle start of module-script (31c EHU-topic.v30 ) 20b \rangle
       ⟨ abort when the language is not English or Dutch 21e⟩
       java -Xmx1000m -jar $MODDIR/ixa-pipe-topic-1.0.1.jar -p $MODDIR/conf.prop
4.5.3 Morphosyntactic parser
```

Module

Fragment referenced in 16a.

Script The morpho-syntactic module parses the sentences with Alpino. Alpino takes a lot of time to handle long sentences. Therefore the morpho-syntactic module has an option $\neg t$ to set a time-out (in minutes) for sentence parsing.

```
"../bin/mor" 31e≡
        \langle start\ of\ module\text{-}script\ (31f\ morphosyntactic\_parser\_nl\ )\ 20b\ \rangle
        ⟨ get the mor time-out parameter 32a ⟩
        ⟨ set alpinohome 22a ⟩
       cat | python $MODDIR/core/morph_syn_parser.py $timeoutarg
Use getopts to read the -t option.
\langle get \ the \ mor \ time-out \ parameter \ 32a \rangle \equiv
       OPTIND=1
       stimeout=
       timeoutarg=
       while getopts "t:" opt; do
            case "$opt" in
            t) stimeout=$OPTARG
            esac
       done
       shift $((OPTIND-1))
       if
          [ $stimeout ]
       then
          timeoutarg="-t $stimeout"
       fi
```

Fragment referenced in 31e.

4.5.4 Pos tagger

In the Dutch pipeline the morpho-syntactic parser fulfills the role of Pos tagger. In the English pipeline we use the pos-tagger from EHU.

Module

4.5 Install modules 35

```
\langle install \ the \ pos \ tagger \ 32b \rangle \equiv
                      cd $modulesdir
                      tar -xzf $snapshotsocket/t_nlpp_resources/20151220_EHU-pos.v30.tgz

4.5.8 UKB
UKB needs boost libraries and Perl version 5. For now, we consider them installed.
Module
\langle install \ the \ UKB \ module \ 34a \rangle \equiv
```

Script Put the path to the boost libraries in the LD_LIBRARY_PATH variable and then run UKB.

```
"../bin/ukb" 34b\\
\( \text{start of module-script} \text{ (34c EHU-ukb.v30 ) 20b} \)
\( \text{cd $MODDIR} \)
\( \text{export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:$envdir/lib:$envdir/boost_1_54_0/stage/lib $\{MODDIR}/naf_ukb/naf_ukb.pl -x $\{MODDIR}/ukb/bin/ukb_wsd -K $\{MODDIR}/wn30-ili_lkb/wn30g.bin64 -D $\{MODDIR}/wn30-ili_lkb/wn30.lex - -- --dict_weight -- dgraph_dfs --dgraph_rank ppr \end{arguments}
```

4.5.9 IMS-WSD

Module The package itself supplies an installation script that seems usable. However, today I am in a hurry and just install the module as it comes from the EHU repository.

Although the Hadoop implementation runs this module with Java 1.7, I could only run ims+wsd Java 1.6. Using Java 1.7 causes run-time errors "Platform not recognised" and the resulting NAF's do not contain WordNet references. So, we had to install Java 1.6.

The scripts contain explicit paths that must be corrected:

```
ims/testPlain: Explicit path to Java binary.
path_to_ims.py: Set variable PATH_TO_IMS.
\langle install \ the \ ims-wsd \ module \ 34d \rangle \equiv
      cd $modulesdir
      tar -xzf $snapshotsocket/t_nlpp_resources/20151220_VUA-ims-wsd.v30.tgz
      cd VUA-ims-wsd.v30
      thisDir='pwd'
      echo PATH_TO_IMS = "'"$thisDir/ims"'" > path_to_ims.py
      cp testPlain.bash old.testPlain.bash
      sedcommand='s|/usr/lib/jvm/java-1.6.0-openjdk-1.6.0.0.x86_64/jre/bin/java|java|g'
      cat old.testPlain.bash | sed $sedcommand >testPlain.bash
Fragment referenced in 17a.
Script
"../bin/ewsd" 35a \equiv
       ⟨ start of module-script (35b VUA-ims-wsd.v30 ) 20b ⟩
       ⟨ set up Java 1.6 10a ⟩
      #Setting the output to be ili-wn30 synsets instead of sensekeys
      $MODDIR/call_ims.py -ili30
```

4.5.10 SRL server

 \Diamond

The EHU SRL-module, that we use for Enghlish documents, has been set up as a server/client system. Hence, we have to start the server before we can process something.

We don't know in advance whether we run the pipeline for a single text or from a whole bunch of text and hence we do not know whether it is advisable that the server keeps running, occupying precious memory. Therefore, currently we just start and stop the server every time that we use it.

```
Module
\langle install \ the \ srl\text{-}server \ module \ 35c \rangle \equiv
        cd $modulesdir
        tar -xzf $snapshotsocket/t_nlpp_resources/20151220_EHU-srl-server.tgz
        cd EHU-srl-server
        mkdir -p /home/phuijgen/nlp/test/nlpp/env/etc/pid
Fragment referenced in 17a.
Scripts Generate three scripts: start_eSRL, stop_esrl and eSRL, resp. to start the SRL server,
to stop it and to process a NAF file.
"../bin/start_eSRL" 35d\equiv
        \langle start \ of \ module - script \ (35e \ EHU-srl-server \ ) \ 20b \rangle
        \langle \ start \ EHU \ SRL \ server \ if \ it \ isn't \ running \ {\bf 36a} \ \rangle
"../bin/stop_eSRL" 35f\equiv

```

4.5.13 FBK-temprel module

```
Module
```

```
\label{eq:constraint} $$ \langle install\ the\ FBK-temprel\ module\ 39a\ \rangle \equiv $$ cd\ \mbox{\$modulesdir}$ $$ tar\ -xzf\ \mbox{\$snapshotsocket/t_nlpp_resources/20151220_FBK-temprel.v30.tgz} $$ \langle repair\ FBK-*rel's\ run.sh.hadoop\ (39b\ FBK-temprel.v30\ )\ \mbox{$39c\ \rangle}$ $$
```

Fragment referenced in 17j.

Script run.sh.hadoop seems to be obsolete in the original tarball:

- 1. The class-path argument in one of the Java statement refers to an obsolete jar (kaflib-naf-1.1.8 instead of kaflib-naf-1.1.9)
- 2. Another class-path argument refers to PredicateTimeAnchor_tlink.jar instead of PredicateTimeAnchor.ja
- 3. A "sh" statement is used. The problem is, that in Ubuntu /bin/sh points to bin/dash and the script (temprel-pipeline-per-file-NWR.sh) does not seem to be compatible with dash.

Therefore, we need to repair the script. We will need to repair the script in the FBK-causalrel module in a similar way, and therefore provide the module-directory as argument.

```
⟨ repair FBK-*rel's run.sh.hadoop 39c ⟩ ≡
    cd $modulesdir/@1
    mv run.sh.hadoop old.run.sh.hadoop
    cat old.run.sh.hadoop | \
        sed s/kaflib-naf-1.1.8/kaflib-naf-1.1.9/g | \
        sed s/TimeAnchor_tlink.jar/TimeAnchor.jar/g | \
        sed "s/sh temprel/bash temprel/g" | \
        sed "s/java /java -Xmx2g /g" \
        >run.sh.hadoop
    chmod 775 run.sh.hadoop
```

Fragment referenced in 39a, 40a.

 \Diamond

Script The original run script seems to not only read the input naf from standard in, but also to obtain the input naf as a file that an argument points to. This constructions makes the pipeline complicated, therefore, we generate the naf file within the script.

The original script generates temporary files in the temp directory of the host-computer, and prefixes the names of the temporary files with a random number to prevent confusion between tempfiles of different instances of this module. We generate a temp-directory per instance.

```
"../bin/FBK-temprel" 39d \( \start of module-script \) (39e FBK-temprel.v30 ) 20b \( \) cd $MODDIR \( \scratchDir='mktemp -d -t temprel.XXXXXX' \) cat >$scratchDir/in.naf \( ./run.sh.hadoop $MODDIR $scratchDir $scratchDir/in.naf \) rm -rf $scratchDir
```

4.5.14 FBK-causalrel module

```
Module
```

```
\label{eq:constall} $$ \langle install\ the\ FBK-causalrel\ module\ 40a\rangle \equiv $$ cd\ \mbox{\$modulesdir}$$ tar\ -xzf\ \mbox{\$snapshotsocket/t_nlpp_resources/20151220_FBK-causalrel.v30.tgz} $$ \langle repair\ FBK-*rel's\ run.sh.hadoop\ (40b\ FBK-causalrel.v30\ )\ \mbox{$39c$} \rangle $$ $$ $$ $$ $$
```

Fragment referenced in 17j.

Like in FBK-temprel, script run.sh.hadoop seems not to work out of the box:

- 1. The class-path argument in one of the Java statement refers to an obsolete jar (kaflib-naf-1.1.8 instead of kaflib-naf-1.1.9)
- 2. A "sh" statement is used. The problem is, that in Ubuntu /bin/sh points to bin/dash and the script (temprel-pipeline-per-file-NWR.sh) does not seem to be compatible with dash

Therefore, we need to repair that script like we did in FBK-temprel.

```
⟨ repair causalrel's run.sh.hadoop 40c ⟩ ≡
    cd $modulesdir/FBK-causalrel.v30
    mv run.sh.hadoop old.run.sh.hadoop
    cat old.run.sh.hadoop | \
        sed s/kaflib-naf-1.1.8/kaflib-naf-1.1.9/g | \
        sed s/TimeAnchor_tlink.jar/TimeAnchor.jar/g | \
        sed s/sh temprel/bash temprel/g | \
        >run.sh.hadoop
    chmod 775 run.sh.hadoop
```

Fragment never referenced.

Script

```
"../bin/FBK-causalrel" 40d=
\( \start \ of \ module \- script \) (40e FBK-causalrel.v30 ) 20b \\

```

4.5.16 Nominal coreference-base

Get this thing from Github (https://github.com/opener-project/coreference-base/) and apply the instruction of https://github.com/opener-project/coreference-base/blob/master/core/README.md. We implement it, but it does not work yet, because it is too picky on the structure of the NAF format.

Module

```
⟨install coreference-base 41c⟩ ≡
    MODNAM=coreference-base
    DIRN=coreference-base
    GITU=https://github.com/opener-project/coreference-base.git
    GITC=bfa5aec0fa498e57fe14dd4d2c51365dd09a0757
    ⟨install from github 6d⟩
    pip install --upgrade hg+https://bitbucket.org/Josu/pykaf#egg=pykaf
    pip install --upgrade networkx
    ⋄

Fragment referenced in 18a.
Uses: hg 19f.
```

Script

```
"../bin/coreference-base" 41d\equiv \langle start\ of\ module\text{-}script\ (41e\ coreference\text{-}base\ )\ 20b\ \rangle cd $MODDIR/core cat | python -m corefgraph.process.file --language nl --singleton --sieves NO \hat{}
```

4.5.17 Named entity recognition (NERC)

Module The Nerc program can be installed from Github (https://github.com/ixa-ehu/ixa-pipe-nerc). However, the model that is needed is not publicly available. Therefore, models have been put in the snapshot-tarball.

```
\langle install\ the\ NERC\ module\ 42a \rangle \equiv \\ \langle compile\ the\ nerc\ jar\ 42b \rangle \\ \langle get\ the\ nerc\ models\ 43a \rangle
\Leftrightarrow
Fragment referenced in 16j.
```

The nerc module is a Java program that is contained in a jar. Put the source from Github in a temporary directory, compile the jar with java and move the jar to the jars directory.

```
⟨ compile the nerc jar 42b⟩ ≡
    TEMPDIR='mktemp -d -t nerc.XXXXXX'
    cd $TEMPDIR
    git clone https://github.com/ixa-ehu/ixa-pipe-nerc
    cd ixa-pipe-nerc/
    git checkout ca02c931bc0b200ccdb8b5795a7552e4cc0d4802
    mvn clean package
    mv target/ixa-pipe-nerc-1.5.4.jar $jarsdir/
    cd $nuwebdir
    rm -rf $TEMPDIR
♦
```

Fragment referenced in 42a.

The current version of the pipeline uses the following models, that have been made available by Rodrigo Agerri on december 15, 2015.

The tarball dutch-nerc-models.tar.gz contains the models nl-clusters-conl102.bin and nl-clusters-sonar.bin Both models have been placed in subdirectory /m4_nerc_nl_dir/nerc_models/nl of the snapshot.

The model for English can be found in the newsreader-repository.

Choose a model dependent of the language.

```
⟨ select language-dependent features 42c ⟩ ≡
    if
        [ "$naflang" == "nl" ]
    then
        export nercmodel=nl/nl-clusters-conl102.bin
    else
        export nercmodel=en/en-newsreader-clusters-3-class-muc7-conl103-ontonotes-4.0.bin
    fi
        ◊
Fragment referenced in 55c.
```

Uses: naflang 21d.

The tarball 20160105_nerc_models.tgz contains in subdirectories nl and en a dutch resp. an english nerc-model. They have been randomly selected from a number of models that are available in http://ixa2.si.ehu.es/ixa-pipes/models/nerc-models-1.5.4.tgz.

```
\langle get the nerc models 43a \rangle \equiv

Script

4.5.20 NED

The NED module is rather picky about the structure of the NAF file. In any case, it does not accept a file that has been produced by the ontotagger. Hence, in a pipeline NED should be executed before the ontotagger.

The NED module wants to consult the Dbpedia Spotlight server, so that one has to be installed somewhere. For this moment, let us suppose that it has been installed on localhost.

Module

```
⟨ install the NED module 45c⟩ ≡
    ⟨ put spotlight jar in the Maven repository 46a⟩
    MODNAM=ned
    DIRN=ixa-pipe-ned
    GITU=https://github.com/ixa-ehu/ixa-pipe-ned.git
    GITC=d35d4df5cb71940bf642bb1a83e2b5b7584010df
    ⟨ install from github 6d⟩
    cd $modulesdir/ixa-pipe-ned
    mvn -Dmaven.compiler.target=1.7 -Dmaven.compiler.source=1.7 clean package
    mv target/ixa-pipe-ned-1.1.1.jar $jarsdir/
    ◇
Fragment referenced in 16j.
```

NED needs to have dbpedia-spotlight-0.7.jar in the local Maven repository. That is a different jar than the jar that we use to start Spotlight.

```
\langle put \ spotlight \ jar \ in \ the \ Maven \ repository \ 46a \rangle \equiv
       echo Put Spotlight jar in the Maven repository.
      tempdir='mktemp -d -t simplespot.XXXXXX'
      cd $tempdir
      wget http://spotlight.sztaki.hu/downloads/archive/2014/dbpedia-spotlight-0.7.jar
      wget http://spotlight.sztaki.hu/downloads/archive/2014/nl.tar.gz
      tar -xzf nl.tar.gz
      MVN_SPOTLIGHT_OPTIONS="-Dfile=dbpedia-spotlight-0.7.jar"
      MVN_SPOTLIGHT_OPTIONS="$MVN_SPOTLIGHT_OPTIONS -DgroupId=ixa"
      MVN_SPOTLIGHT_OPTIONS="$MVN_SPOTLIGHT_OPTIONS -DartifactId=dbpedia-spotlight"
      MVN_SPOTLIGHT_OPTIONS="$MVN_SPOTLIGHT_OPTIONS -Dversion=0.7"
      MVN_SPOTLIGHT_OPTIONS="$MVN_SPOTLIGHT_OPTIONS -Dpackaging=jar"
      MVN_SPOTLIGHT_OPTIONS="$MVN_SPOTLIGHT_OPTIONS -DgeneratePom=true"
      mvn install:install-file $MVN_SPOTLIGHT_OPTIONS
      cd $PROJROOT
      rm -rf $tempdir
Fragment referenced in 45c.
Script NED needs to contact a Spotlight-server.
"../bin/ned" 46b\equiv
       ⟨ start of module-script (46c ) 20b ⟩
      #!/bin/bash
      source /home/phuijgen/nlp/test/nlpp/env/bin/progenv
      ROOT=$piperoot
      JARDIR=$jarsdir
        [ "$naflang" == "nl" ]
      then
        spotlightport=2060
      else
        spotlightport=2020
      fi
       [ $spotlightrunning ] || source /home/phuijgen/nlp/test/nlpp/bin/start-spotlight
      cat | java -Xmx1000m -jar $jarsdir/ixa-pipe-ned-1.1.1.jar -
      H http://$spotlighthost -p $spotlightport -e candidates -
      i $envdir/spotlight/wikipedia-db -n nlEn
```

4.5.21 Ontotagger

Fragment referenced in 18a.

We do not yet have a source-repository of the Ontotagger module. Therefore, install from a snap-shot (20160126_vua-ontotagger-v1.0.tgz).

```
Module
```

```
⟨ install the onto module 46d⟩ ≡
    cd $modulesdir
    tar -xzf $snapshotsocket/t_nlpp_resources/20160126_vua-ontotagger-v1.0.tgz
    chmod -R o+r $modulesdir/vua-ontotagger-v1.0
```

Script

```
"../bin/onto" 47a\equiv
        ⟨ start of module-script (47b vua-ontotagger-v1.0 ) 20b ⟩
       JARDIR=$MODDIR/lib
       RESOURCESDIR=$MODDIR/resources
       PREDICATEMATRIX="$RESOURCESDIR/PredicateMatrix.v1.3.txt.role.odwn"
       GRAMMATICALWORDS="$RESOURCESDIR/grammaticals/Grammatical-words.nl"
       TMPFIL='mktemp -t stap6.XXXXXX'
       cat >$TMPFIL
       {\tt CLASSPATH=\$JARDIR/ontotagger-1.0-jar-with-dependencies.jar}
       JAVASCRIPT=eu.kyotoproject.main.KafPredicateMatrixTagger
       MAPPINGS="fn;mcr;ili;eso"
       JAVA_ARGS="--mappings $MAPPINGS"
       JAVA_ARGS="$JAVA_ARGS --key odwn-eq"
       JAVA_ARGS="$JAVA_ARGS" --version 1.2"

JAVA_ARGS="$JAVA_ARGS" --predicate-matrix $PREDICATEMATRIX"

JAVA_ARGS="$JAVA_ARGS" --grammatical-words $GRAMMATICALWORDS"

JAVA_ARGS="$JAVA_ARGS" --naf-file $TMPFIL"
       java -Xmx1812m -cp $CLASSPATH $JAVASCRIPT $JAVA_ARGS
       rm -rf $TMPFIL
       \Diamond
```

4.5.22 Framenet SRL

The framenet SRL is part of the package that contains the ontotagger. We only need a different script.

Script The script contains a hack, because the framesrl script produces spurious lines containining "frameMap.size()=...". A GAWK script removes these lines.

```
"../bin/framesrl" 48a \equiv
      ⟨ start of module-script (48b vua-ontotagger-v1.0 ) 20b ⟩
      ONTODIR=$modulesdir/vua-ontotagger-v1.0
      JARDIR=$MODDIR/lib
      RESOURCESDIR=$MODDIR/resources
      PREDICATEMATRIX="$RESOURCESDIR/PredicateMatrix_nl_lu_withESO.vO.2.role.txt"
      GRAMMATICALWORDS="$RESOURCESDIR/grammaticals/Grammatical-words.nl"
      TMPFIL='mktemp -t framesrl.XXXXXX'
      cat >$TMPFIL
      {\tt CLASSPATH=\$JARDIR/ontotagger-1.0-jar-with-dependencies.jar}
      JAVASCRIPT=eu.kyotoproject.main.SrlFrameNetTagger
      JAVA_ARGS="--naf-file $TMPFIL"
      JAVA_ARGS="$JAVA_ARGS --format naf"
      JAVA_ARGS="$JAVA_ARGS --frame-ns fn:"
      JAVA_ARGS="$JAVA_ARGS
                             --role-ns fn-role:;pb-role:;fn-pb-role:;eso-role:"
                             --ili-ns mcr:ili"
      JAVA_ARGS="$JAVA_ARGS
                             --sense-conf 0.25"
      JAVA_ARGS="$JAVA_ARGS
      JAVA_ARGS="$JAVA_ARGS --frame-conf 70"
      java -Xmx1812m -
      cp $CLASSPATH $JAVASCRIPT $JAVA_ARGS | gawk '/^frameMap.size()/ {next}; {print}'
      rm -rf $TMPFIL
```

4.5.23 Heideltime

Fragment referenced in 48c.

Module The code for Heideltime can be found in Github. However, we use a compiled Heideltime Jar, compiled by Antske Fokkens, because some bugs have been repaired in that version.

Use Heideltime via a wrapper, ixa-pipe-time, obtained from Github.

Heideltime uses treetagger. It expects to find the location of treetagger in a variable TreetaggerHome in config-file config.props.

```
⟨ install the heideltime module 48c⟩ ≡
    moduledir=/home/phuijgen/nlp/test/nlpp/modules/ixa-pipe-time
    ⟨ clone the heideltime wrapper 48d⟩
    ⟨ put Antske's material in the heideltime wrapper 49a⟩
    ⟨ compile the heideltime wrapper 49b⟩
    ⋄

Fragment referenced in 18h.

⟨ clone the heideltime wrapper 48d⟩ ≡
    MODNAM=heideltime
    DIRN=ixa-pipe-time
    GITU=https://github.com/ixa-ehu/ixa-pipe-time.git
    GITC=da4604a7b33975e977017440cbc10f7d59917ddf
    ⟨ install from github (48e ixa-pipe-time ) 6d⟩
    mkdir $moduledir/lib
    ⋄
```

In the wrapper we need the following extra material:

• A debugged version of the Heidelberg jar.

Fragment referenced in 49b.

Fragment referenced in 49b.

- A configuration file config.props, although it does not seem to be actually used.
- Another configuration file: alpino-to-treetagger.csv

The extra material has been provided by Antske Fokkens.

```
\langle put \ Antske's \ material \ in \ the \ heideltime \ wrapper \ 49a \rangle \equiv
       cd $modulesdir/$DIRN
       \verb|tar-xzf| $snapshotsocket/t_nlpp_resources/20151123_antske_heideltime_stuff.tgz| \\
       mv antske_heideltime_stuff/de.unihd.dbs.heideltime.standalone.jar lib/
       mv antske_heideltime_stuff/config.props .
       mv antske_heideltime_stuff/alpino-to-treetagger.csv .
       rm -rf antske_heideltime_stuff
Fragment referenced in 48c.
Compile the Heideltime wrapper according to the instruction on Github.
\langle compile the heideltime wrapper 49b \rangle \equiv
        \langle get jvntextpro-2.0.jar 49c \rangle
        ⟨ activate the install-to-project-repo utility 49d ⟩
       cd /home/phuijgen/nlp/test/nlpp/modules/$DIRN
       mvn clean install
Fragment referenced in 48c.
\langle\;get\;jvntextpro\text{-}2.0.jar\;49c\;\rangle\equiv
        cd /home/phuijgen/nlp/test/nlpp/modules/$DIRN/lib
       wget http://ixa2.si.ehu.es/%7Ejibalari/jvntextpro-2.0.jar
```

Script install-to-project-repo.py generates a library in subdirectory repo and copies the jars that it finds in the lib subdirectory in this repo in such a way that Maven finds it there. Somewhere in the install-to-project.py...mvn process the jars are copied in your local repository (~/.m2) too. As a result, only a Maven Guru understands precisely where Maven obtains its jar from and the best thing to do is to empty the repo subdirectory and the local repository before (re-) applying install-to-project-repo.py.

```
⟨ activate the install-to-project-repo utility 49d ⟩ ≡
    ⟨ remove outdated heideltime jars 50a ⟩
    cd /home/phuijgen/nlp/test/nlpp/modules/$DIRN/
    git clone git@github.com:carchrae/install-to-project-repo.git
    mv install-to-project-repo/install-to-project-repo.py .
    rm -rf install-to-project-repo
    python ./install-to-project-repo.py
```

```
\langle remove \ outdated \ heideltime \ jars \ 50a \rangle \equiv
       rm -rf /home/phuijgen/nlp/test/nlpp/modules/$DIRN/repo
       mkdir -p /home/phuijgen/nlp/test/nlpp/modules/$DIRN/repo/local
       rm -rf $HOME/.m2/repository/local/de.unihd.dbs.heideltime.standalone
       rm -rf $HOME/.m2/repository/local/jvntextpro-2.0
Fragment referenced in 49d.
Script
"../bin/heideltime" 50b\equiv

⟨ start of module-script (50c ixa-pipe-time ) 20b ⟩
       MODDIR=$modulesdir/ixa-pipe-time
       cd $MODDIR
       iconv -t utf-8//IGNORE | java -Xmx1000m -jar target/ixa.pipe.time.jar -m alpino-to-
       {\tt treetagger.csv\ -c\ config.props}
4.5.24 Semantic Role labelling
Module
\langle install \ the \ srl \ module \ 50d \rangle \equiv
       MODNAM=srl
       DIRN=vua-srl-nl
       GITU=https://github.com/newsreader/vua-srl-nl.git

       \langle install \ from \ github \ \mathbf{6d} \ \rangle
Fragment referenced in 18h.
Script First:
1.
       set the correct environment. The module needs python and timble.
       create a tempdir and in that dir a file to store the input and a (SCV) file with the feature-
       vector.
"../bin/srl" 50e=
       \langle start \ of \ module\text{-}script \ (50f \ vua-srl-nl \ ) \ 20b \ \rangle
       MODDIR=$modulesdir/vua-srl-nl
       TEMPDIR='mktemp -d -t SRLTMP.XXXXXX'
       cd $MODDIR
       INPUTFILE=$TEMPDIR/inputfile
       FEATUREVECTOR=$TEMPDIR/csvfile
       TIMBLOUTPUTFILE=$TEMPDIR/timblpredictions
File defined by 50e, 51abcd.
```

Create a feature-vector.

```
"../bin/srl" 51a=
       cat | tee $INPUTFILE | python nafAlpinoToSRLFeatures.py > $FEATUREVECTOR
File defined by 50e, 51abcd.
Run the trained model on the feature-vector.
"../bin/srl" 51b≡
       timbl -m0:I1,2,3,4 -i 25Feb2015_e-mags_mags_press_newspapers.wgt -
       t $FEATUREVECTOR -o $TIMBLOUTPUTFILE >/dev/null 2>/dev/null
File defined by 50e, 51abcd.
Insert the SRL values into the NAF file.
"../bin/srl" 51c≡
       python timblToAlpinoNAF.py $INPUTFILE $TIMBLOUTPUTFILE
File defined by 50e, 51abcd.
Clean up.
"../bin/srl" 51d
       rm -rf $TEMPDIR
File defined by 50e, 51abcd.
4.5.25 SRL postprocessing
In addition to the Semantic Role Labeling there is hack that finds additional semantic roles.
Module Get the module from Github. Note that this module needs rdflib
\langle install \ python \ packages \ 51e \rangle \equiv
       pip install rdflib
       \Diamond
Fragment defined by 13f, 51e.
Fragment referenced in 10b.
Defines: rdflib Never used.
\langle install \ the \ post-SRL \ module \ 51f \rangle \equiv
       cd $modulesdir
       if
         [ -d vua-srl-postprocess ]
       then
         cd vua-srl-postprocess
         git pull
         git clone https://github.com/newsreader/vua-srl-postprocess.git
         cd vua-srl-postprocess
       fi
```

Fragment referenced in 18q.

```
Script
```

```

cd $MODDIR

tempdir='mktemp -d -t postsrl.XXXXX'

cat >$tempdir/infile

python $MODDIR/main.py -i $tempdir/infile -o $tempdir/outfile

cat $tempdir/outfile

rm -rf $tempdir
```

4.5.26 Event coreference

The event-coreference module is language-independent. Although the version in the EHU-repo is 3.0, the version 2.0 used in this pipeline seems to be more recent, so we will use that.

Module Install the module from the snapshot.

Fragment referenced in 18h.

Script

```
"../bin/evcoref" 52d\equiv
      ⟨ start of module-script (52e vua-eventcoreference_v2 ) 20b ⟩
      RESOURCESDIR=$MODDIR/resources
      JARFILE=$jarsdir/EventCoreference-1.0-SNAPSHOT-jar-with-dependencies.jar
      if
        [ "$naflang" == 'nl' ]
      then
        lang_resource="odwn_orbn_gwg-LMF_1.3.xml"
      else
        lang_resource="wneng-30.lmf.xml.xpos"
      {\tt JAVAMODULE=eu.newsreader.event} coreference.naf. {\tt EventCorefWordnetSim}
      JAVAOPTIONS="--method leacock-chodorow"
      JAVAOPTIONS="$JAVAOPTIONS --wn-lmf $RESOURCESDIR/$lang_resource"
      JAVAOPTIONS="$JAVAOPTIONS --sim 2.0"
      JAVAOPTIONS="$JAVAOPTIONS --wsd 0.8"
      JAVAOPTIONS="$JAVAOPTIONS --
      relations XPOS_NEAR_SYNONYM#HAS_HYPERONYM#HAS_XPOS_HYPERONYM#event"
      java -Xmx812m -cp $JARFILE $JAVAMODULE $JAVAOPTIONS
```

\rightarrow

4.5.27 Dbpedia-ner

Dbpedia-ner finds more named entities that NER, because it checks DBpedia for the candidate NE-'s.

Module

```
⟨ install the dbpedia-ner module 53a ⟩ ≡
MODNAM=dbpedia_ner
DIRN=dbpedia_ner
GITU=https://github.com/PaulHuygen/dbpedia_ner.git
GITC=ab1dcbd860f0ff29bc979f646dc382122a101fc2
⟨ install from github 6d ⟩
♦
```

Script The main part of the module is a Python script. The README.md file of the Github repo lists the options that can be applied. One of the options is about the URL of the Spotlight server.

```
"../bin/dbpner" 53b=
\( \start \ of module-script \) (53c \ dbpedia_ner ) 20b \\
\text{cat | iconv -f IS08859-1 -t UTF-8 | $MODDIR/dbpedia_ner.py - url http://$spotlighthost:2060/rest/candidates}
```

4.5.28 Nominal events

Fragment referenced in 18q.

The module "postprocessing-nl" adds nominal events to the srl annotations. It has been obtained directly from the author (Piek Vossen). It is not yet available in a public repo. Probably in future versions the jar from the ontotagger module can be used for this module.

```
Module
```

Script

```
"../bin/nomevent" 53e\( \sqrt{of module-script}\) (53f vua-nominal-event-detection-nl ) 20b \\ \text{LIBDIR=$MODDIR/lib} \\ \text{RESOURCESDIR=$MODDIR/resources} \\

JAR=$LIBDIR/ontotagger-1.0-jar-with-dependencies.jar \\
JAVAMODULE=eu.kyotoproject.main.NominalEventCoreference \\
\text{cat} | java -Xmx812m -cp $JAR $JAVAMODULE --framenet-lu $RESOURCESDIR/nl-luIndex.xml}
\( \text{cat} \)
```

4.5.29 Opinion miner

To run the opinion-miner, the following things are needed:

- SVMlight
- crfsuite
- vua-pylib

Module The module can be cloned from Github. However, currently there are problems with the Github installation. Therefore we borrow the opinion miner from the English NWR pipeline.

The opinion-miner needs a configuration file that is located in the directory where the model-data resides. In this pipeline we will use model-data derived from news-articles. An alternative model, derived from hotel evaluations can also be used. Put the configuration file in the etc subdir and copy it to its proper location during the installation of the opinion-miner.

```
"../env/etc/opini.cfg" 54b\equiv
       [general]
       output_folder = /home/phuijgen/nlp/test/nlpp/modules/VUA-opinion-
      miner/final_models/ennl/news_cfg1
       [crfsuite]
      path_to_binary = /home/phuijgen/nlp/test/nlpp/env/bin/crfsuite
      path_to_binary_learn = /home/phuijgen/nlp/test/nlpp/env/bin/svm_learn
      path_to_binary_classify = /home/phuijgen/nlp/test/nlpp/env/bin/svm_classify
\langle install \ the \ opinion-miner \ 54c \rangle \equiv
       cd VUA-opinion-miner
      cat /home/phuijgen/nlp/test/nlpp/env/etc/opini.cfg | \
         sed s/ennl/nl/g > $modulesdir/VUA-opinion-
      miner/final_models/nl/news_cfg1/config.cfg
      cat /home/phuijgen/nlp/test/nlpp/env/etc/opini.cfg | \
         sed s/ennl/en/g > $modulesdir/VUA-opinion-
      miner/final_models/en/news_cfg1/config.cfg
Fragment defined by 54ac.
Fragment referenced in 19a.
```

```
"../bin/opinimin" 55a\( \) \( \start \ of \ module - script \) (55b VUA-opinion-miner \) 20b \\\ cd \$MODDIR \\
    export PATH=\$PATH:. \\
    if \[ [ "\$naflang" == "nl" ] \\

A How to read and translate this document

This document is an example of *literate programming* [?]. It contains the code of all sorts of scripts and programs, combined with explaining texts. In this document the literate programming tool nuweb is used, that is currently available from Sourceforge (URL:nuweb.sourceforge.net). The advantages of Nuweb are, that it can be used for every programming language and scripting language, that it can contain multiple program sources and that it is very simple.

A.1 Read this document

The document contains *code scraps* that are collected into output files. An output file (e.g. output.fil) shows up in the text as follows:

```
"output.fil" 4a ≡
# output.fil
< a macro 4b >
< another macro 4c >
```

The above construction contains text for the file. It is labelled with a code (in this case 4a) The constructions between the < and > brackets are macro's, placeholders for texts that can be found in other places of the document. The test for a macro is found in constructions that look like:

```
< a macro 4b > \equiv This is a scrap of code inside the macro.
   It is concatenated with other scraps inside the macro. The concatenated scraps replace the invocation of the macro.

Macro defined by 4b, 87e
Macro referenced in 4a
Macro's can be defined on different places. They can contain other macro's.
< a scrap 87e > \equiv This is another scrap in the macro. It is concatenated to the text of scrap 4b.
   This scrap contains another macro:
        < another macro 45b >

Macro defined by 4b, 87e
Macro referenced in 4a
```

A.2 Process the document

The raw document is named a_nlpp.w. Figure 2 shows pathways to translate it into printable/viewable documents and to extract the program sources. Table 4 lists the tools that are

Tool	Source	Description
gawk	www.gnu.org/software/gawk/	text-processing scripting language
M4	www.gnu.org/software/m4/	Gnu macro processor
nuweb	nuweb.sourceforge.net	Literate programming tool
tex	www.ctan.org	Typesetting system
tex4ht	www.ctan.org	Convert TFX documents into xml/html

Table 4: Tools to translate this document into readable code and to extract the program sources

needed for a translation. Most of the tools (except Nuweb) are available on a well-equipped Linux system.

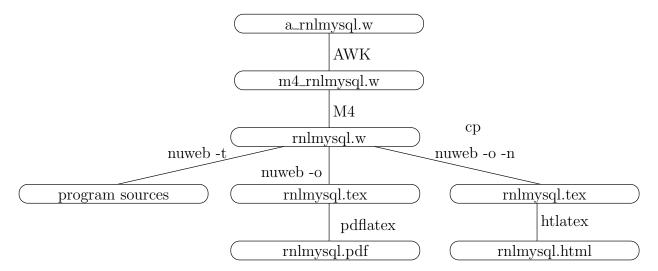

Figure 2: Translation of the raw code of this document into printable/viewable documents and into program sources. The figure shows the pathways and the main files involved.

```
⟨ parameters in Makefile 59a⟩ ≡
NUWEB=../env/bin/nuweb

Fragment defined by 59a, 60c, 62ab, 64d, 67a, 69d.
Fragment referenced in 59b.
Uses: nuweb 66b.
```

A.3 The Makefile for this project.

This chapter assembles the Makefile for this project.

```
"Makefile" 59b≡
⟨ default target 59c⟩
⟨ parameters in Makefile 59a, ...⟩
⟨ impliciete make regels 63a, ...⟩
⟨ expliciete make regels 60d, ...⟩
⟨ make targets 60a, ...⟩
◇

The default target of make is all.
⟨ default target 59c⟩ ≡
all:⟨ all targets 60b⟩
. PHONY: all
```

Defines: all 29b, PHONY 63b.

```
\langle \ make \ targets \ 60a \ \rangle \equiv clean: \langle \ clean \ up \ 8f, \dots \ \rangle \diamond Fragment defined by 60a, 64ab, 67e, 70acd. Fragment referenced in 59b.
```

One of the targets is certainly the PDF version of this document.

```
\langle \ all \ targets \ 60b \ \rangle \equiv $ nlpp.pdf\diamond Fragment referenced in 59c. Uses: pdf 64a.
```

We use many suffixes that were not known by the C-programmers who constructed the make utility. Add these suffixes to the list.

```
\label{eq:continuous} \langle \mbox{ parameters in Makefile } 60c \rangle \equiv \\ . \mbox{SUFFIXES: .pdf .w .tex .html .aux .log .php} \mbox{$\diamond$} Fragment defined by 59a, 60c, 62ab, 64d, 67a, 69d. Fragment referenced in 59b. Defines: SUFFIXES Never used. Uses: pdf 64a.
```

A.4 Get Nuweb

An annoying problem is, that this program uses nuweb, a utility that is seldom installed on a computer. Therefore, we are going to install that first if it is not present. Unfortunately, nuweb is hosted on sourceforge and it is difficult to achieve automatic downloading from that repository. Therefore I copied one of the versions on a location from where it can be downloaded with a script.

Put the nuweb binary in the nuweb subdirectory, so that it can be used before the directory-structure has been generated.

A.5 Pre-processing

To make usable things from the raw input a_nlpp.w, do the following:

- 1. Process \$ characters.
- 2. Run the m4 pre-processor.
- 3. Run nuweb.

This results in a LATEX file, that can be converted into a PDF or a HTML document, and in the program sources and scripts.

A.5.1 Process 'dollar' characters

Fragment defined by 60d, 61bcd, 63b, 65a, 67bd.

Fragment referenced in 59b.

Many "intelligent" TEX editors (e.g. the auctex utility of Emacs) handle \$ characters as special, to switch into mathematics mode. This is irritating in program texts, that often contain \$ characters as well. Therefore, we make a stub, that translates the two-character sequence \\$ into the single \$ character.

A.6 Typeset this document

Enable the following:

- 1. Create a PDF document.
- 2. Print the typeset document.
- 3. View the typeset document with a viewer.
- 4. Create a HTMLdocument.

In the three items, a typeset PDF document is required or it is the requirement itself.

A.6.1 Figures

This document contains figures that have been made by xfig. Post-process the figures to enable inclusion in this document.

The list of figures to be included:

```
\langle \ parameters \ in \ Makefile \ 62a \rangle \equiv FIGFILES=fileschema directorystructure \diamond Fragment defined by 59a, 60c, 62ab, 64d, 67a, 69d. Fragment referenced in 59b. Defines: FIGFILES 62b.
```

We use the package figlatex to include the pictures. This package expects two files with extensions .pdftex and .pdftex_t for pdflatex and two files with extensions .pstex and .pstex_t for the latex/dvips combination. Probably tex4ht uses the latter two formats too.

Make lists of the graphical files that have to be present for latex/pdflatex:

Create the graph files with program fig2dev:

```
\langle impliciete\ make\ regels\ 63a \rangle \equiv
       %.eps: %.fig
                fig2dev -L eps $< > $@
       %.pstex: %.fig
                fig2dev -L pstex $< > $@
       .PRECIOUS : %.pstex
       %.pstex_t: %.fig %.pstex
                fig2dev -L pstex_t -p $*.pstex $< > $0
       %.pdftex: %.fig
                fig2dev -L pdftex $< > $@
       .PRECIOUS : %.pdftex
       %.pdftex_t: %.fig %.pstex
                fig2dev -L pdftex_t -p $*.pdftex $< > $@
Fragment defined by 63a, 67c.
Fragment referenced in 59b.
Defines: fig2dev Never used.
```

A.6.2 Bibliography

To keep this document portable, create a portable bibliography file. It works as follows: This document refers in the |bibliography| statement to the local bib-file nlpp.bib. To create this file, copy the auxiliary file to another file auxfil.aux, but replace the argument of the command \bibdata{nlpp} to the names of the bibliography files that contain the actual references (they should exist on the computer on which you try this). This procedure should only be performed on the computer of the author. Therefore, it is dependent of a binary file on his computer.

A.6.3 Create a printable/viewable document

Make a PDF document for printing and viewing.

Create the PDF document. This may involve multiple runs of nuweb, the LATEX processor and the bibTEX processor, and depends on the state of the aux file that the LATEX processor creates as a by-product. Therefore, this is performed in a separate script, w2pdf.

The w2pdf script The three processors nuweb, L4TeX and bibTeX are intertwined. L4TeX and bibTeX create parameters or change the value of parameters, and write them in an auxiliary file. The other processors may need those values to produce the correct output. The L4TeX processor may even need the parameters in a second run. Therefore, consider the creation of the (PDF) document finished when none of the processors causes the auxiliary file to change. This is performed by a shell script w2pdf.

The following is an ugly fix of an unsolved problem. Currently I develop this thing, while it resides on a remote computer that is connected via the **sshfs** filesystem. On my home computer I cannot run executables on this system, but on my work-computer I can. Therefore, place the following script on a local directory.

```
\langle explicite make regels 65a \rangle \equiv
       $(W2PDF) : nlpp.w $(NUWEB)
                $(NUWEB) nlpp.w
Fragment defined by 60d, 61bcd, 63b, 65a, 67bd.
Fragment referenced in 59b.
"../nuweb/bin/w2pdf" 65b\equiv
       #!/bin/bash
       # w2pdf -- compile a nuweb file
       # usage: w2pdf [filename]
       # 20160218 at 1054h: Generated by nuweb from a_nlpp.w
       NUWEB=../env/bin/nuweb
       LATEXCOMPILER=pdflatex
       ⟨ filenames in nuweb compile script 65d ⟩
       ⟨ compile nuweb 65c ⟩
       \Diamond
Uses: nuweb 66b.
```

The script retains a copy of the latest version of the auxiliary file. Then it runs the four processors nuweb, LATEX, MakeIndex and bibTEX, until they do not change the auxiliary file or the index.

The user provides the name of the nuweb file as argument. Strip the extension (e.g. .w) from the filename and create the names of the LATEX file (ends with .tex), the auxiliary file (ends with .aux) and the copy of the auxiliary file (add old. as a prefix to the auxiliary filename).

```
⟨ filenames in nuweb compile script 65d ⟩ ≡
    nufil=$1
    trunk=${1%%.*}
    texfil=${trunk}.tex
    auxfil=${trunk}.aux
    oldaux=old.${trunk}.aux
    indexfil=${trunk}.idx
    oldindexfil=old.${trunk}.idx
    oldindexfil=old.${trunk}.idx
}
Fragment referenced in 65b.
Defines: auxfil 66c, 68c, 69a, indexfil 66c, 68c, nufil 66b, 68c, 69b, oldaux 66ac, 68c, 69a, oldindexfil 66c, 68c, texfil 66b, 68c, 69b, trunk 66b, 68c, 69bc.
```

Remove the old copy if it is no longer needed.

Run the three processors. Do not use the option -o (to suppres generation of program sources) for nuweb, because w2pdf must be kept up to date as well.

Repeat to copy the auxiliary file and the index file and run the processors until the auxiliary file and the index file are equal to their copies. However, since I have not yet been able to test the aux file and the idx in the same test statement, currently only the aux file is tested.

It turns out, that sometimes a strange loop occurs in which the aux file will keep to change. Therefore, with a counter we prevent the loop to occur more than 10 times.

```
\langle run \ the \ processors \ until \ the \ aux \ file \ remains \ unchanged \ 66c \rangle \equiv
       LOOPCOUNTER=0
       while
          ! cmp -s $auxfil $oldaux
        do
          if [ -e $auxfil ]
           cp $auxfil $oldaux
          fi
          if [ -e $indexfil ]
          then
           cp $indexfil $oldindexfil
          fi
          ⟨ run the three processors 66b⟩
          if [ $LOOPCOUNTER -ge 10 ]
            cp $auxfil $oldaux
          fi;
        done
Fragment referenced in 65c.
```

Uses: auxfil 65d, 68c, indexfil 65d, oldaux 65d, 68c, oldindexfil 65d.

A.6.4 Create HTML files

HTML is easier to read on-line than a PDF document that was made for printing. We use tex4ht to generate HTML code. An advantage of this system is, that we can include figures in the same way as we do for pdflatex.

To create a HTML doc, we do the following:

- 1. Create a directory ../nuweb/html for the HTML document.
- 2. Put the nuweb source in it, together with style-files that are needed (see variable HTMLSOURCE).
- 3. Put the script w2html in it and make it executable.
- 4. Execute the script w2html.

Fragment referenced in 59b.

Make a list of the entities that we mentioned above:

```
\langle parameters in Makefile 67a \rangle \equiv
        htmldir=../nuweb/html
        htmlsource=nlpp.w nlpp.bib html.sty artikel3.4ht w2html
        htmlmaterial=$(foreach fil, $(htmlsource), $(htmldir)/$(fil))
        htmltarget=$(htmldir)/nlpp.html
Fragment defined by 59a, 60c, 62ab, 64d, 67a, 69d.
Fragment referenced in 59b.
Uses: nuweb 66b.
Make the directory:
\langle explicite make regels 67b \rangle \equiv
        $(htmldir) :
                 mkdir -p $(htmldir)
Fragment defined by 60d, 61bcd, 63b, 65a, 67bd.
Fragment referenced in 59b.
The rule to copy files in it:
\langle\;impliciete\;make\;regels\;67c\;\rangle\equiv
        $(htmldir)/% : % $(htmldir)
                  cp $< $(htmldir)/</pre>
        \Diamond
Fragment defined by 63a, 67c.
Fragment referenced in 59b.
Do the work:
\langle explicite make regels 67d \rangle \equiv
        $(htmltarget) : $(htmlmaterial) $(htmldir)
                  cd $(htmldir) && chmod 775 w2html
                  cd $(htmldir) && ./w2html nlpp.w
Fragment defined by 60d, 61bcd, 63b, 65a, 67bd.
Fragment referenced in 59b.
Invoke:
\langle make\ targets\ 67e \rangle \equiv
        htm : $(htmldir) $(htmltarget)
        \Diamond
Fragment defined by 60a, 64ab, 67e, 70acd.
```

Create a script that performs the translation.

```
"w2html" 68a≡

#!/bin/bash

# w2html -- make a html file from a nuweb file

# usage: w2html [filename]

# [filename]: Name of the nuweb source file.

# 20160218 at 1054h: Generated by nuweb from a_nlpp.w echo "translate " $1 >w2html.log

NUWEB=/home/phuijgen/nlp/test/nlpp/env/bin/nuweb

⟨ filenames in w2html 68c⟩

⟨ perform the task of w2html 68b⟩

Uses: nuweb 66b.
```

The script is very much like the w2pdf script, but at this moment I have still difficulties to compile the source smoothly into HTML and that is why I make a separate file and do not recycle parts from the other file. However, the file works similar.

```
\langle perform the task of w2html 68b\rangle \equiv \langle run the html processors until the aux file remains unchanged 69a\rangle \langle remove the copy of the aux file 66a\rangle \diamond Fragment referenced in 68a.
```

The user provides the name of the nuweb file as argument. Strip the extension (e.g. .w) from the filename and create the names of the LATEX file (ends with .tex), the auxiliary file (ends with .aux) and the copy of the auxiliary file (add old. as a prefix to the auxiliary filename).

```
⟨ filenames in w2html 68c ⟩ ≡
    nufil=$1
    trunk=${1\%.*}
    texfil=${trunk}.tex
    auxfil=${trunk}.aux
    oldaux=old.${trunk}.aux
    indexfil=${trunk}.idx
    oldindexfil=old.${trunk}.idx
    oldindexfil=old.${trunk
```

To work for HTML, nuweb must be run with the -n option, because there are no page numbers.

When the compilation has been satisfied, run makeindex in a special way, run bibtex again (I don't know why this is necessary) and then run htlatex another time.

A.7 Create the program sources

Run nuweb, but suppress the creation of the LATEX documentation. Nuweb creates only sources that do not yet exist or that have been modified. Therefore make does not have to check this. However, "make" has to create the directories for the sources if they do not yet exist. So, let's create the directories first.

```
\langle make\ targets\ 70a \rangle \equiv
        DIRS = \langle directories to create 4a, ... \rangle
        $(DIRS) :
                   $(MKDIR) $@
Fragment defined by 60a, 64ab, 67e, 70acd.
Fragment referenced in 59b.
Defines: DIRS 70c.
Uses: MKDIR 69d.
\langle make\ scripts\ executable\ 70b \rangle \equiv
        chmod -R 775 ../bin/*
        chmod -R 775 ../env/bin/*
Fragment defined by 19d, 21c, 70b.
Fragment referenced in 70c.
\langle make \ targets \ 70c \rangle \equiv
        sources : nlpp.w $(DIRS) $(NUWEB)
                   $(NUWEB) nlpp.w
                   ⟨ make scripts executable 19d, . . . ⟩
        \Diamond
Fragment defined by 60a, 64ab, 67e, 70acd.
Fragment referenced in 59b.
Uses: DIRS 70a.
```

A.8 Restore paths after transplantation

When an existing installation has been transplanted to another location, many path indications have to be adapted to the new situation. The scripts that are generated by nuweb can be repaired by re-running nuweb. After that, configuration files of some modules must be modified.

In order to work as expected, the following script must be re-made after a transplantation.

```
"../env/bin/transplant" 71
       #!/bin/bash
       LOGLEVEL=1
       \langle set variables that point to the directory-structure 4e, ... \rangle
       ⟨ set paths after transplantation 12c ⟩
       ⟨ re-install modules after the transplantation 24d ⟩
